Key Words: 1,4-Dihydropyridines. Aromatization. Selenium dioxide. SiO$_2$/P$_2$O$_5$. Heterogeneous conditions

The oxidation of Hantzsch 1,4-dihydropyridines to corresponding pyridines has been extensively studied in view of the pertinence of the reaction to the metabolism of Hantzsch esters and the calcium channel blocking drugs used in the treatment of various cardiovascular disorders. Consequently, this aromatization reaction continues to attract the attention of researchers for the discovery of milder and general protocols applicable to a wide range of 1,4-dihydropyridines.

Numerous reagents and procedures have been recommended for this purpose such as manganese dioxide or DDQ, nitric oxide, bismuth nitrate pentahydrate, tetra kis-pyridine cobalt (II) dichromate (TPCD), niobium dichromate, Na$_2$O$_2$ complex of 18-crown-6, MCl$_2$/NaNO$_2$/wet SiO$_2$, silica chloride/NaNO$_2$/wet SiO$_2$, H$_2$O$_2$/Co(OAc)$_2$, NaHSO$_3$/Na$_2$Cr$_2$O$_7$/wet SiO$_2$, peroxy-disulfate-cobalt (II), Zr(NO$_3$)$_4$, hypervalent iodine reagents, Co(II) catalyzed auto-oxidation, sodium nitrite or nitrosonium, 1-methoxyethanol and heteropolyacids/NaNO$_2$/wet SiO$_2$. A literature survey showed that three other systems that have been used for dehydrogenation of 1,4-dihydropyridines are catalysis by cytochrome P-450, electrochemical and a homogenous complex of palladium as catalyst. Recently, selenium dioxide in acetic acid has been reported for the oxidation of 1,4-dihydropyridines. Although variety of reagents are capable of effecting these oxidations, this transformation is not always so easy and can be a difficult step if the substrate have functional groups within the molecule sensitive to the oxidizing agent and reaction conditions. Most of the reported reagents produce byproducts which are difficult to remove. Therefore, the development of more effective method for the aromatization of 1,4-DHP’s under milder conditions is still necessary.

The introduction of supported reagents for bringing about various chemical transformations has provided an attractive option for organic synthesis. These reagents not only modify the activity but also may impart product selectivity. In addition, the work-up procedure becomes quite easier.

Keeping in view our interest in oxidation processes, we have developed a practical and general approach for the oxidative conversion of 1,4-dihydropyridines (1a-m) to corresponding pyridines (2a-m) using SiO$_2$/P$_2$O$_5$-SeO$_2$ as reagent system under stirring in CH$_2$Cl$_2$ at 40°C (Scheme 1).

Results and Discussion

Recently, SiO$_2$/P$_2$O$_5$-HNO$_3$ has been used for the oxidation of sulfides to corresponding sulfoxides. Keeping in view the mildness of this reagent system, we have tried to carry out the aromatization of 4-phenyl-1,4-dihydropyridine (1a) by simple grinding in a pestle and mortar at room temperature in solvent-free conditions. It was found that oxidation did take place but in addition to oxidation, ring nitration was also observed. The reagent SiO$_2$/P$_2$O$_5$ is quite stable and can be stored in a desiccator for several weeks. So, we decided to carry out oxidation of 4-phenyl-1,4-dihydropyridine using SiO$_2$/P$_2$O$_5$ reagent and SeO$_2$ as oxidizing agent by grinding at room temperature in solvent-free conditions. It was found that reaction did take place but didn’t proceed to completion.

*All products were characterized by ¹H NMR, IR, mass spectral data and comparison with authentic samples prepared according to literature methods. The time at which 100% conversion of 1,4-dihydropyridine was observed on TLC. Isolated yield, 4-Dealkylated product (15%), based on separation by column chromatography, was also formed.

A series of 1,4-dihydropyridines were synthesized to investigate their conversion to corresponding pyridines. Initially, 4-phenyl-1,4-dihydropyridine (1a) was used as a substrate to test the feasibility of SiO₂/P₂O₅-SeO₂ for the oxidation. After carrying out reactions under different conditions, it was found that for 1 mmole of each of 1a and SeO₂, 0.3 g of SiO₂/P₂O₅ and 5 mL of methylene chloride was required to proceed the reaction under mild conditions and gave high efficiency in terms of yield and reaction time. Using similar conditions, other dihydropyridines (1b-m) were oxidized and excellent results were obtained (Table 1).

Experimental Section

General. Silica gel (K100, 0.063-0.200 mm) was purchased from Merck, Germany and phosphorus pentoxide from Himedia, India. Melting points were determined on a Tempest melting point apparatus and are uncorrected. ¹H NMR spectra were obtained on a Bruker DPX-200 NMR spectrometer (200 MHz) in CDCl₃ using tetramethylsilane as an internal standard and IR spectra were recorded using KBr disc on Perkin Elmer FTIR spectrophotometer. The mass spectral data was obtained on a JEOL, JMS-D300 spectrometer. The reactions were monitored qualitatively by TLC.

Preparation of silica supported phosphorus pentoxide (SiO₂/P₂O₅). Silica gel (10 g, K100, 0.063-0.200 mm) was mixed with phosphorus pentoxide (2 g) and grinded in a pestle and mortar for 15 minutes. The homogenous powder was stored in a vacuum desiccator and can be used for several weeks.

Oxidative aromatization of 1,4-dihydropyridines with SiO₂/P₂O₅-SeO₂. General procedure. A suspension of 1,4-dihydropyridine (1 mmol), re-sublimed selenium dioxide (1 mmol) and SiO₂/P₂O₅ (0.3 g) in CH₂Cl₂ (5 mL) was stirred at 40 °C for an appropriate time (monitored by TLC, Table 1). After completion of the reaction, the reaction mixture was filtered and the residue was washed with CH₂Cl₂ (2 × 5 mL). The product obtained after removal of the solvent under reduced pressure was purified by passing through column of silica gel and elution with pet ether/EtOAc.

The structures of the products were confirmed by ¹H NMR, IR, mass spectral data and comparison with authentic samples prepared according to the literature methods.

Conclusion

In conclusion, we have found that SiO₂/P₂O₅-SeO₂ is an efficient reagent for the aromatization of 1,4-dihydropyridines to corresponding pyridines under mild and heterogeneous conditions. The salient features of our method are: it is simple, rapid, cost-effective, general and selective. In addition, this could be a valuable addition to the existing methods for the oxidation of 1,4-dihydropyridines.
