OWL-S Ontology

Build on the OWL (Ontology Web Language)

The diagram illustrates the OWL-S ontology structure. A central 'Service' node is connected to 'Service Profile' (labeled 'presents'), 'Service Grounding' (labeled 'supports (what to access it)'), and 'Service Model' (labeled 'described by (how it works)'). 'Service Profile' is further linked to 'Service Name', 'Service Description', and 'QoS'. 'Service Grounding' is linked to 'Input/Output Data type', 'Input/Output Constraint', and 'Process Structure'. 'Service Model' is also linked to 'Input/Output Data type', 'Input/Output Constraint', and 'Process Structure'.

TM-S

- Topic Maps for Services
- Define Knowledge Model for Service using XTM(XML Topic Maps)
- Supports the strong points of OWL-S and MIT Process Handbook, but also complements their weak points
 - Service Profile Ontology : OWL-S
 - Service Model Ontology : OWL-S
 - Service/Process View Ontology : MIT Process Handbook

The diagram shows a 'Sell' service at the top. It branches into two sub-services: 'Sell how?' and 'Sell what?'. 'Sell how?' is further divided into 'Sell via store' and 'Sell via electronic store'. 'Sell what?' is divided into 'Sell product' and 'Sell computer'.

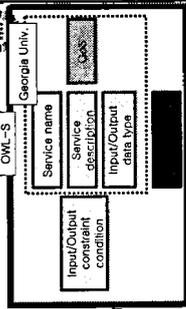

CMU's Matchmaking

- Matching based on Keyword
 - Context Matching
 - Profile comparison (TF-IDF)
- Data Type Matching of Input/Output parameter
 - name : using word distance DB
 - (computer, notebook), (computer, book)
 - Data type : using subtyping inference rule
- Constraint Matching of Input/Output parameter
 - $(Pre_s \Rightarrow Post_s) \wedge (Post_t \Rightarrow Post_s)$
 - θ -subsumption relationship
- No Process Structure Matching and QoS Matching

The diagram shows the CMU's Matchmaking ontology structure. It includes 'Service name', 'Service description', 'Input/Output data type', 'Input/Output constraint condition', and 'QoS'.

Georgia University's MatchMaking

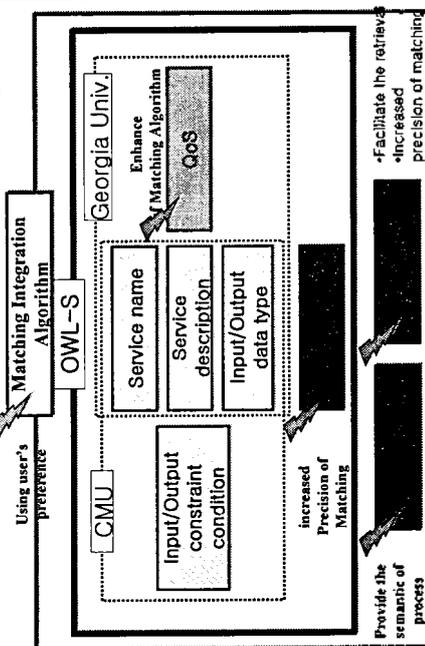

- Matching based on Keyword
 - Matching of Service name
 - Matching of Service Description
 - TF-IDF
- Data Type Matching of Input/Output parameter
 - Evaluate the similarity of data type
- QoS Matching
 - time, cost, reliability
 - Evaluate the similarity between Query QoS and Service QoS
- No Process Structure Matching and constraint Matching of Input/Output parameter

Problem of Semantic Web Service MatchMaking

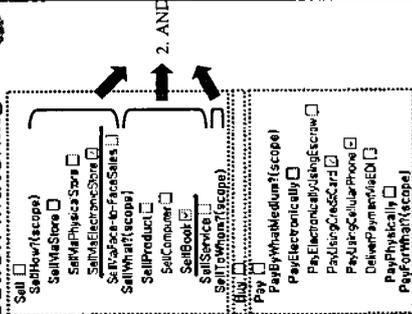

- Matching based on keyword
- Not support the constraint Matching of Input/Output parameter
 - "Search the service which the user can order the book, if and when it have the valid credit card (precondition)"
- Not support the Matching for Process Structure
 - "Search the book purchase service, where the user expects to login and pay (sequence)"
- Not support the QoS Matching
 - Progressing the research in the QoS

Our idea for Service MatchMaking

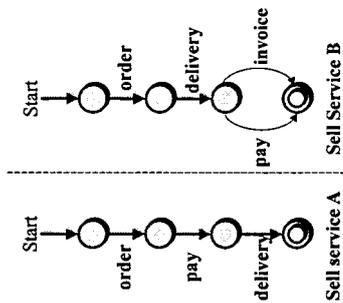

Service/Process Classification Matching

- Classification
 - Classify by view point of service/process (MIT Process Handbook)
 - Query "Search the service to sell book via Electronic Store"
- Algorithm
 - Relation among top classes : OR
 - Relation between classes in same root : AND

Process Structure Matching

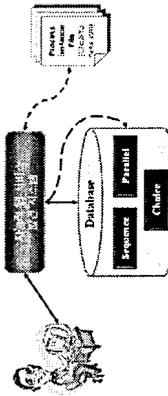

- Two sell service
- However, there are different services
- Require the Matching for Process Structure

Process Matching Algorithm

- Sequence Structure
 - Sequence
 - Query "Search the book purchase service, where the user expects to login and pay(sequence)"
- Parallel Structure
 - Split, split+Join
 - Query "Search the book purchase service processing with delivery and stock update"
- Choice Structure
 - If-then-else
 - Query "Search the book purchase service, where the user expects to credit card payment or account payment"

Process Matching Algorithm

- Sequence Structure

| | | |
|-------------------|---------|-------------|
| RootProcess | Process | NextProcess |
| CNUBuyBookProcess | Login | Payment |
- Parallel Structure

| | |
|-------------------|-----------------|
| RootProcess | ParallelProcess |
| CNUBuyBookProcess | Delivery |
| CNUBuyBookProcess | UpdateStock |
- Choice Structure

| | | |
|-------------------|-------------------|----------------------|
| RootProcess | ThenProcess | ElseProcess |
| CNUBuyBookProcess | PaymentCreditCard | PaymentOnlineBanking |

Process Pattern Matching

- In ebXML
 - Business Transaction
 - Request/Confirm
 - Request/Response
 - Query/Response
 - Notification
 - Information Distribution
- When the user search the service aspect of business modeling
 - To provide an established semantics of process interactions
 - Query "Find the service designed Business Transaction pattern"

QoS Matching in Georgia University

- QoS components
 - time, cost, reliability : minimum, average, maximum
- Evaluate the similarity
 - $d_{cd} : \text{distance of two components (query QoS and service QoS)}$
 $d_{cd_{min}}(ST, SO, dim) = 1 - \frac{\min(SO_{qos(dim)}) - \min(ST_{qos(dim)})}{\min(ST_{qos(dim)})}$
 - $QoSdimD : \text{square root of min, aver, max } d_{cd}$
 $QoSdimD(ST, SO, dim) = \sqrt{d_{cd_{min}}(ST, SO, dim) * d_{cd_{avg}}(ST, SO, dim) * d_{cd_{max}}(ST, SO, dim)}$
 - final result : Square root of QoSdimD in All QoS
 $OpSimilarity(ST, SO) = \sqrt{QoSdimD(ST, SO, time) * QoSdimD(ST, SO, cost) * QoSdimD(ST, SO, reliability)}$

Problem 1 of QoS

- It cannot a good service, even so the service have high QoS similarity

| Reliability | Min | Avg | Max |
|-----------------------------------|-------|-----|-----|
| Query | 90 | 94 | 99 |
| S1 | 90 | 93 | 99 |
| S2 | 90 | 98 | 99 |
| Distance between Query and S1 | 0 | 1 | 0 |
| Distance between Query and S2 | 0 | 4 | 0 |
| The similarity between S1 and QoS | 0.985 | | |
| The similarity between S2 and QoS | 0.978 | | |

Problem 2 of QoS

- A specific component can lead the whole similarity

| Cost | Min | Avg | Max |
|-------------------------------|-----|-----|-----|
| Query | 200 | 250 | 300 |
| S1 | 200 | 240 | 300 |
| S2 | 200 | 290 | 300 |
| Distance between Query and S1 | 0 | 10 | 0 |
| Distance between Query and S2 | 0 | 50 | 0 |

| reliability | Min | Avg | Max |
|-------------------------------|-----|-----|-----|
| Query | 90 | 94 | 99 |
| S1 | 87 | 96 | 98 |
| S2 | 90 | 94 | 99 |
| Distance between Query and S1 | 3 | 2 | 1 |
| Distance between Query and S2 | 0 | 0 | 0 |

Whole similarity

| | |
|---------------|-------|
| S1 similarity | 0.973 |
| S2 similarity | 0.957 |

QoS Matching Algorithm

- Components
 - Cost, Time, Reliability, Accuracy, Availability, Last Update Time
- suppose
 - Select the average of QoS components
 - The more a whole QoS is low, the more preference and quality is high
- Algorithm
 - Select the service in the scope of query
 - Mediate the QoS value
 - Evaluate the standard value
 - Evaluate the whole QoS value
 - Sorting and decision

Mediate and evaluate of QoS value

- Mediate the QoS value
 - Complement the problem 1
 - The more a whole QoS is low, the more preference and quality is high : cost, time
 - Evaluate of the Standard value
 - Complement the problem 2
 - know the position where the service's QoS is in whole QoS
- The more a whole QoS is high, the more preference and quality is high
 - Reliability, Accuracy, Availability (max 100% - QoS value)
 - Last update time (current time - QoS value)

$$T(S, cost) = \left[\frac{S1 \cdot cost - m}{S} \right] \times 10^{-50}$$

$$q = \frac{(S1 \cdot cost - m)^2 + 4 \cdot S^2 \cdot cost \cdot m^2}{n}$$

$n =$ average, $n =$ number of service

$$TotalScore(S) = T(S, cost) + T(S, time) + T(S, reliability) + T(S, accuracy) + T(S, availability) + T(S, lastUpdateTime)$$

17

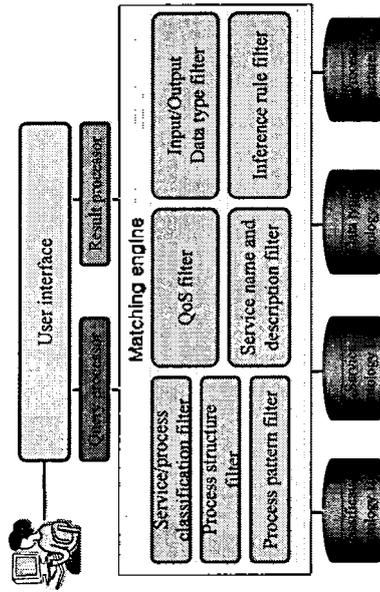

Example of QoS Matching

- Query : find the services what have the cost of \$600 or under, the reliability of 85% and over

| | S1 | S2 | S3 | S4 | S5 | S6 | S7 |
|--------------------------------|-------|-------|-------|-------|--------|--------|-----|
| Cost | 250 | 250 | 300 | 350 | 550 | 570 | 650 |
| Reliability | 95 | 97 | 90 | 90 | 85 | 99 | 80 |
| Standard value of cost | 40.35 | 40.35 | 44.11 | 47.87 | 62.91 | 64.41 | |
| Standard value of reliability | 39.74 | 39.51 | 40.33 | 40.33 | 40.91 | 39.27 | |
| whole QoS value | 80.09 | 79.86 | 84.44 | 88.20 | 103.82 | 103.68 | |
| QoS rank | 2 | 1 | 3 | 4 | 6 | 5 | |
| QoS rank in Georgia university | 5 | 6 | 4 | 3 | 1 | 2 | |

18

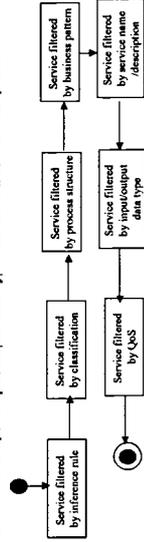

System Architecture

17

Query Process Algorithm

- Efficient query process
 - Select Matching filters which Matching speed is fast and efficient filter is high
 - The next, the input/output data type filter and QoS filter that process slow

- Integration and sorting
- Considering the user's preference
 - No the similarity
 - Service/process classification filter, inference rule filter, process structure filter, transaction filter
 - Have the similarity value
 - Service namedescription filter, Input/Output datatype filter, QoS filter

18

Integration algorithm

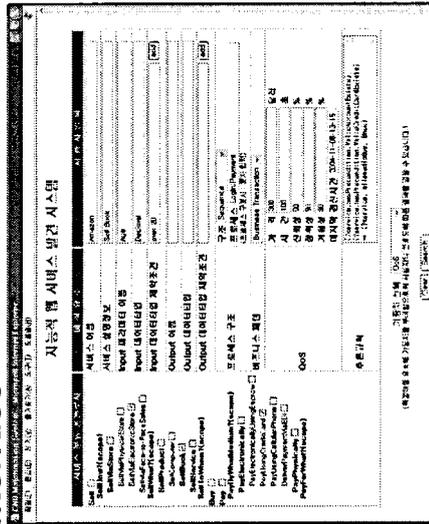

- The scope of similarity
 - ◆ Name and description filter
 - ◆ $S_{name} = S_{desc} : 0-100$
 - ◆ Input/Output datatype filter
 - ◆ $S_{input} = S_{output} : 0-1$
 - ◆ QoS filter
 - ◆ $S_{qos} : 0-600$
- Control the similarity value to setting the value 0 to 100
 - ◆ The more QoS value is high, the ranking is high
 - ◆ $N_{name} = N_{desc} : (S_{name} - S_{desc}) \times 1$
 - ◆ $N_{input} = N_{output} : (S_{input} - S_{output}) \times 100$
 - ◆ $N_{qos} : (600 - S_{qos}) \times 1/5$
- Multiply the preference value
 - ◆ $W_{qos} = N_{qos} \times 3$
- Add similarity values of whole filter
 - ◆ $Total = W_{name} + W_{desc} + W_{input} + W_{output} + W_{qos}$

Example of Integration algorithm

| | S1 | S2 | S3 | S4 | S5 |
|------------------------------|---------------|------------|------------|---------------|---------------|
| $S_{name} \times 1$ | 99 | 90 | 85 | 70 | 50 |
| $N_{name} \times 1$ | 99 | 90 | 85 | 70 | 50 |
| $S_{input} \times 100$ | 0.75 | 0.3 | 0.5 | 0.7 | 0.8 |
| $N_{input} \times 1$ | 75 | 30 | 50 | 70 | 80 |
| $S_{output} \times 100$ | 0.75 | 0.3 | 0.5 | 0.7 | 0.8 |
| $N_{output} \times 1$ | 75 | 30 | 50 | 70 | 80 |
| $(600 - S_{qos}) \times 1/5$ | 400 | 150 | 300 | 250 | 500 |
| $N_{qos} \times 3$ | 33.33 | 75 | 50 | 58.33 | 16.67 |
| W_{qos} | 99.99 | 225 | 150 | 174.99 | 50.01 |
| Total | 273.99 | 345 | 285 | 314.99 | 180.01 |
| rank | 4 | 1 | 3 | 2 | 5 |

User Interface

- OS: Windows XP Professional
- Language: JAVA(J2SD K.1.4.1_02)
- Environment: Jakarta Tomcat 4.1.29 OKS Professional 2.0.2 Jena 2.1
