

Superconductivity R&D in Korea: Status and Perspectives

Jong-Chul Park

Korea Research Institute of Standards and Science

Superconductivity research in Korea has come a long way since the discovery of high temperature superconductor in 1987. Korea changed from a nation which had practically no research activity on superconductivity into one of few countries where application research was actively being pursued. In this talk superconductivity R&D activities and achievements in Korea during the last two decades will be discussed, together with some thoughts on future prospects.
