NOTE ON INFINITESIMAL TRANSFORMATION
IN NORMAL CONTACT SPACE

By Jae Koo Ahn

Introduction. Recently, S. Sasaki defined the notion of \((\phi, \xi, \eta, g)\)-structure of a differentiable manifold[1], and he and Y. Hatakeyama studied its geometric properties[2]. Furthermore, S. Sasaki, Y. Hatakeyama and M. Okumura defined a normal contact space and discussed many interesting theorems in this space[3]. In this space, problems concerning infinitesimal transformations were studied by M. Okumura and S. Tanno[4], [5].

In the present note we investigate the relations among several infinitesimal transformations.

In section 1, we state the fundamental properties of the normal contact space and the definitions of these infinitesimal transformations as the preparation of this note.

We show the results of this note in section 2 and prove them in section 3 successively.

1. Preliminaries. On an \(N(=2n+1)\)-dimensional real differentiable manifold, if there exist a tensor field \(\phi^i_j\), contravariant and covariant vector fields \(\xi^i\) and \(\eta_i\) satisfying the relations

\[
\begin{align*}
(1,1) & \quad \xi^i \eta_i = 1, \\
(1,2) & \quad \text{rank } ||\phi^i_j|| = n-1, \\
(1,3) & \quad \phi^i_j \xi^j = 0, \\
(1,4) & \quad \phi^i_j \eta_j = 0, \\
(1,5) & \quad \phi^i_j \phi^k_j = -\phi^i_k + \xi^i \eta_k.
\end{align*}
\]

then we call the notion \((\phi^i_j, \xi^i, \eta_i)\) a \((\phi, \xi, \eta)\)-structure and the manifold a manifold with a \((\phi, \xi, \eta)\)-structure. It is well known that a manifold with a \((\phi, \xi, \eta)\)-structure always admits a positive definite Riemannian metric tensor \(g_{ij}\) such
that

\[(1,6) \quad g_{ji} \xi^j = \eta_j,\]
\[(1,7) \quad g_{ji} \phi^i_k \phi^i_h = g_{kh} - \eta_k \eta_h.\]

We call such a notion \((\phi^i, \xi^i, \eta_j, g_{ji})\) satisfying above properties a \((\phi, \xi, \eta, g)\)-structure and the manifold a manifold with a \((\phi, \xi, \eta, g)\)-structure. In this note, we always consider such a Riemannian metric tensor, and thus we use a notation \(\eta^i\) in stead of \(\xi^i\).

Next, let \(M\) be a differentiable manifold with a contact structure

\[\eta = \eta_i dx^i.\]

If we define \(\phi_{ji}\) by

\[2 \phi_{ji} = \partial_j \eta_i - \partial_i \eta_j, \quad (\eta_i = \partial/\partial x^i),\]

we can introduce a Riemannian metric \(g_{ji}\) such that

\[(1,8) \quad \phi^i_j = g^{hr} \phi_{ir},\]
\[(1,9) \quad \xi^i = g^{ir} \eta_r,\]

where \(\eta_i, g_{ji}, \phi^i_j\) define a \((\phi, \xi, \eta, g)\)-structure.

S. Sasaki and Y. Hatakeyama introduce four important tensor fields \(N^h_{ji}\), \(N^i_{ji}\), \(N^i_{ji}\), and if \(N^h_{ji}\) vanishes, the other three tensors vanish. We call the contact space with vanishing \(N^h_{ji}\) a normal contact space.

In a normal contact space, the following identities are always valid[3],

\[(1,10) \quad \nabla_j \eta_i = \phi_{ji},\]
\[(1,11) \quad \nabla_k \phi_{ji} = \nabla_k \nabla_j \eta_i = \eta_j g_{k} - \eta_i g_{jk},\]
\[(1,12) \quad \eta_i R_{kji} = \eta_i g_{jk} - \eta_k g_{ji},\]
\[(1,13) \quad \nabla_i \nabla_k \phi_{ji} = \phi_{ij} g_{ik} - \phi_{ik} g_{ij}.\]
Note on Infinitesimal Transformations in Normal Contact Space

\[ (1.14) \quad -\phi_j R^i_{jk} - \phi_r R^r_{ik} = \phi_{ij} g_{ik} - \phi_{kj} g_{il} + \phi_{li} g_{jk} + \phi_{ki} g_{jl}, \]

where \( R^i_{jk} \) is a Riemannian curvature tensor, and \( \nabla_j \) is the differentiation with respect to Riemannian connection.

In a Riemannian space, if the vector field \( v^i \) satisfies

\[ (1.15) \quad \mathcal{L}_v g_{ji} = \nabla_j v_i + \nabla_i v_j = 0, \]
\[ (1.16) \quad \mathcal{L}_v g_{ji} = \nabla_j v_i + \nabla_i v_j = 2 \sigma g_{ji}, \]
\[ (1.17) \quad \mathcal{L}_v [h]_{jj} = \nabla_j v_i v^h + R_{rji}^h v^r = 0, \]
and

\[ (1.18) \quad \mathcal{L}_v [h]_{jj} = \nabla_j v_i v^h + R_{rji}^h v^r = \sigma_j \delta_i^h + \rho_j \delta_i^j + \sigma_j c_i, \]

then the vector \( v^i \) is called respectively an infinitesimal isometry (or Killing vector), an infinitesimal conformal transformation (or conformal Killing vector), an infinitesimal affine collineation, and an infinitesimal projective transformation, where \( \sigma \) is a certain scalar function called by an associated scalar of the transformation and \( \rho_j \) is a certain vector field called by an associated vector of the transformation. If \( v^i \) admits a conformal Killing, then it holds

\[ (1.19) \quad \mathcal{L}_v [h]_{jj} = \nabla_j v_i v^h + R_{rji}^h v^r = \sigma_j \delta_i^h + \rho_j \delta_i^j + \sigma_j c_i, \]

\[ (\sigma_i = \partial_i \sigma). \]

Next, let us recall the identities of Lie derivatives. For any vector field \( v^i \) and tensor field \( T_{ji}^h \), we have the following identities:

\[ (1.20) \quad \mathcal{L}_v T_{ji}^h = v^a \nabla_a T_{j}^h + T_{ai}^h \nabla_j v^a + T_{ja}^h \nabla_i v^a - T_{ji}^a \nabla_a v^h, \]
\[ (1.21) \quad \mathcal{L}_v \nabla_m T_{ji}^h - \nabla_m \mathcal{L}_v T_{ji}^h = -T_{ai}^h \mathcal{L}_v [jim]_{a}^h + T_{ja}^h \mathcal{L}_v [jim]_{a}^h + T_{ja}^a \mathcal{L}_v [jim]_{a}, \]
\[ (1.22) \quad \nabla_h \mathcal{L}_v [jim]_{a}^h - \mathcal{L}_v \nabla_h [jim]_{a}^h = \mathcal{L}_v R_{kji}^h. \]

In a normal contact space, if the vector field \( v^i \) satisfies
and
\[(1, 24) \quad \mathfrak{L}_{\nu} \phi^j = 0.\]

then we call the vector \(v^j\) an infinitesimal contact transformation (\(\tau\) is an associated scalar of the transformation) and an \textit{infinitesimally \(\phi\)-invariant transformation} respectively, and especially, when \(\tau\) vanishes \(v^j\) is called by an infinitesimal strict contact transformation.

Transvecting \((1, 23)\) with \(\eta^j\), we have
\[(1, 25) \quad \tau = \eta^b \mathfrak{L}_{\nu} \eta_i = \eta^b \nabla_c v_b.\]

2. Results. In this section, we summarize the results of the present note as followings:

(I). \textit{In a contact space, if an infinitesimal contact transformation admits an infinitesimal isometry, then it is strict and the length of the vector field \(\eta^j\) is invariant under the infinitesimal isometry.}

Next, we consider the normal contact space, and then, do not refer the space in the followings.

(1). \textit{If an infinitesimal isometry \(v^j\) is infinitesimally \(\phi\)-invariant, then it admits an infinitesimal strict contact transformation and the length of the vector \(v^j\) is constant along the curve tangented to direction \(\eta^j\).}

(II). \textit{If an infinitesimal affine collineation is infinitesimally \(\phi\)-invariant, then it admits an infinitesimal strict contact transformation and an infinitesimal isometry.}

(III). \textit{If an infinitesimal projective transformation is infinitesimally \(\phi\)-invariant, then it admits a conformal Killing.}

(V). \textit{If a conformal Killing is infinitesimally \(\phi\)-invariant, then it admits an infinitesimal isometry.}

(IV). \textit{If an infinitesimal contact transformation \(v^j\) is infinitesimally \(\phi\)-invariant, then its associated scalar \(\tau\) is represented by}
\[(2, 1) \quad \tau = -\frac{2}{N+1} \nabla_a v^a.\]
Note on Infinitesimal Transformations in Normal Contact Space

(1). If an infinitesimal contact transformation admits an infinitesimal affine collineation, then its associated scalar \( \tau \) is represented by (2.1) and constant along the curve tangented to direction \( \gamma^i \). If an infinitesimal isometry \( \psi^j \) admits an infinitesimal contact transformation, or if an infinitesimal affine collineation admits an infinitesimal strict contact transformation, then it holds

\[
(2.2) \quad \nabla_a \psi^a = 0.
\]

(2). If an infinitesimal contact transformation \( \psi^j \) admits an infinitesimal projective transformation, then its associated scalar \( \tau \) is represented by (2.1) and a direction \( \tau_k - 2\rho_k \) is orthogonal to the direction \( \gamma^i \). Furthermore if the transformation is strict, then it admits an infinitesimal affine collineation.

(3). If an infinitesimal contact transformation admits a conformal Killing, then it admits an infinitesimal isometry and strict contact transformation.

3. Proofs. In this section, we prove above results successively.

(1). Let \( \psi^j \) be an infinitesimal contact transformation, then we have

\[
\mathcal{L}_v \gamma_j = \tau \gamma_j.
\]

Since \( \psi^j \) admits an infinitesimal isometry, we have

\[
\mathcal{L}_v \gamma^i = \tau \gamma^i.
\]

Taking Lie derivative of (1.5), we obtain by means of above

\[
\phi^i_j \mathcal{L}_v \phi^j_k + \phi^i_k \mathcal{L}_v \phi^j_j = 2\tau \eta^i \eta_k.
\]

Transvecting this with \( \eta^k \eta_i \) we have

\[
(3.1) \quad \tau = 0,
\]

and thus, it is strict.

Form (3.1) and (1.25), we have

\[
(3.2) \quad \eta^i \mathcal{L}_v \eta_i = 0.
\]

Since \( \psi^j \) admits an infinitesimal isometry, we obtain

\[
(3.3) \quad \mathcal{L}_v \gamma^i = 0.
\]
(I). Taking Lie derivative of (1.5) and \( v^j \) being infinitesimally \( \phi \)-invariant, we have

\[
(3.4) \quad \eta^j \mathcal{L}_\nu \eta_k + \eta_k \mathcal{L}_\nu \eta^j = 0.
\]

Transvecting this with \( \eta_j \), we have

\[
\mathcal{L}_\nu \eta_k + \eta_k \eta_a \mathcal{L}_\nu \eta^a = 0.
\]

Since \( v^j \) admits an infinitesimal isometry, it is reduced into

\[
(3.5) \quad \mathcal{L}_\nu \eta^k + \eta^k \eta_a \mathcal{L}_\nu \eta^a = 0.
\]

Transvecting this with \( \eta_k \), we have

\[
\eta_a \mathcal{L}_\nu \eta^a = 0.
\]

and thus, we obtain that \( v^j \) admits an infinitesimal strict contact transformation.

On the other hand, (3.4) is reduced into

\[
\eta_k \left( v^a \nabla_a \eta^j - \eta^a \nabla_a v^j \right) + \eta^j \left( v^a \nabla_a \eta_k + \eta_a \nabla_k v^a \right) = 0.
\]

Transvecting this with \( \eta^k \) and taking account of (1.8) and (1.10), we have

\[
v^a \phi_{ai} - \eta^a \nabla_a v_i = 0,
\]

since \( v^j \) is an infinitesimal isometry. Transvecting this with \( v^j \), by virtue of skew-symmetric property of \( \phi_{ai} \), we have

\[
v^j \eta^i \nabla_i v_j = 0,
\]

or

\[
\eta^a \nabla_a v^2 = 0,
\]

and thus, (I) has been proved.

(II). For any vector \( v^j \), it holds

\[
(3.6) \quad \mathcal{L}_\nu \phi_{ij} - \nabla_k \mathcal{L}_\nu \phi_{kj} = \phi_{ai} \mathcal{L}_\nu \left\{ \phi^a_{(i} \right\} - \phi_{ai} \mathcal{L}_\nu \left\{ \phi^a_{k)} \right\}.
\]

From the assumption, we have
Note on Infinitesimal Transformations in Normal Contact Space

\[ \mathcal{L}_v \nabla_k \phi^i_j = 0. \]

Substituting (1.11) into this, we have

\[ \mathcal{L}_v (\gamma^i_j \phi^j_k - \phi^i_k g_{kj}) = 0, \]

and it is reduced into

\[ (3.7) \quad (\nu^a \nabla_a \gamma^i_j + \gamma^i_a \nabla_j \nu^a) \phi^j_k - (\nu^a \phi^j_k \gamma^i_j - \phi^i_k \gamma^i_j \nu^a) g_{kj} - \gamma^i_j (\nabla_k v_j + \nabla_j v_k) = 0. \]

Contracting with respect to \( i \) and \( k \), we have

\[ (3.8) \quad \nu^a \nabla_a \gamma^i_j + \gamma^i_a \nabla_j \nu^a = 0, \]

or

\[ \mathcal{L}_v \gamma^i_j = 0, \]

and hence, we have proved former of \((\mathcal{I})\).

Next, in consequence of (3.8), (3.7) is reduced into

\[ \gamma^i_j (\nabla_k v_j + \nabla_j v_k) = - (\nu^a \phi^j_k \gamma^i_j - \phi^i_k \gamma^i_j \nu^a) g_{kj}. \]

Transvecting this with \( \gamma_i \), we have

\[ (3.9) \quad \nabla_k v_j + \nabla_j v_k = (\nu^a \phi^j_k \gamma^i_j - \phi^i_k \gamma^i_j \nu^a) g_{kj}. \]

In consequence of (1, 25) and the former of this theorem, we have

\[ \nabla_k v_j + \nabla_j v_k = 0, \]

and thus, \((\mathcal{I})\) has been proved.

\((\mathcal{N})\), From (3.6) and the assumption we have by means of (1.11)

\[ (3.10) \quad (\nu^a \nabla_a \eta^i_j + \eta^i_a \nabla_j \nu^a) \phi^j_k - (\nu^a \phi^j_k \eta^i_j - \phi^i_k \eta^i_j \nu^a) g_{kj} - \eta^i_j (\nabla_k v_j + \nabla_j v_k) = \phi^a_j (\rho_k \delta^i_a + \rho_a \delta^i_k) - \phi^i_k (\rho_k \delta^a_j + \rho_j \delta^a_k). \]

Contracting with respect to \( i \) and \( k \), we have, in consequence of \( \phi^a_i = 0, \)

\[ \nu^a \nabla_a \eta^i_j + \eta^i_a \nabla_j \nu^a = \frac{N}{N-1} \phi^a_j \rho^a_j. \]
Substituting this into (3.10), we have
\[
\frac{N}{N-1} \delta^k_j \delta^i_a - (\nu^a \nabla_a \eta^j - \eta^a \nabla_a \nu^j) g_{kj} - \eta^i (\nabla_k \nu_j + \nabla_j \nu_k) \\
= \phi_j^a (\rho_a \delta^i_k + \rho_a \delta^i_j) - \phi_a^i (\rho_k \delta^j_a + \rho_j \delta^k_a).
\]
Transvecting this with \( \eta_j \), we have
\[
(3.11) \quad \nabla_k \nu_j + \nabla_j \nu_k = \frac{1}{N-1} \phi_j^a \rho_a \eta_k + g_{kj} \eta^a \nabla_b \nu_a.
\]
Interchanging \( j \) and \( k \), and subtracting these, we have
\[
(\phi_j^a \eta_j - \phi_j^a \eta_k) \rho_a = 0.
\]
Transvecting this with \( \eta_j \), we obtain
\[
\phi_j^a \rho_a = 0.
\]
Form this, (3.11) is reduced into
\[
\nabla_k \nu_j + \nabla_j \nu_k = (\eta^k \nabla_c \nu_b) g_{kj},
\]
and thus, we have proved (N).

(V). From (3.6), we have in consequence of the assumption and (1.19)
\[
\nu^a \nabla_a \phi_j^i + \nabla_a \phi_j^i \nabla_k \nu^a + \nabla_k \phi_j^i \nabla_j \nu^a - \nabla_k \phi_j^a \nabla_a \nu^j \\
= -\phi_j^a \sigma_j + g_{kj} \sigma^a \phi_a^i + \sigma_k \phi_j^a \sigma_a - \sigma^j \phi_{jk},
\]
and from (1.11), it is reduced into
\[
(3.12) \quad g_{ih} \nu^a \nabla_a \eta_j - g_{kj} \nu^a \nabla_a \eta_i - \eta_i \nabla_k \nu_j + \eta_j \nabla_k \nu_i - \eta_i \nabla_j \nu_k + \eta_k \nabla_j \nu_i \\
= -\phi_{ki} \sigma_j + g_{kj} \sigma^a \phi_{ai} + g_{ki} \sigma_a \phi^a_j - \sigma_j \phi_{jk}.
\]
Transvecting this with \( g^{jk} \eta^i \), we have
\[
(3.13) \quad 2 \nabla_a \nu_a = (N+1) \eta^c \eta^b \nabla_c \nu_b.
\]
On the other hand, since \( \nu^i \) admits a conformal Killing, it holds
\[
(3.14) \quad \nabla_b \nu_b + \nabla_b \nu_c = 2 \sigma g_{cb}.
\]
Transvecting this with $g^{cb}$ and $\gamma^c \gamma^b$, then we obtain respectively

$$\nabla^a v_a = N \sigma,$$

and

$$\gamma^c \gamma^b \nabla_c v_b = \sigma.$$

Substituting these into (3.13), we have

$$(N - 1) \sigma = 0,$$

or

$$\sigma = 0,$$

and thus, we have proved (V).

(V). For any vector $v^j$, it holds

$$(3.15) \quad \nabla_v \eta_j - \nabla_k \eta_j = \frac{\sigma}{g_{kj}}.\nabla_v \eta_j = -\eta_a \nabla_k \nabla_j v^a - v^a \nabla_k \nabla_j v^a.$$

By assumption, from (1.10) and (1.17) this is reduced into

$$(\nabla_j v_a + \nabla_a v_j) (g^{kj} - \eta^k \eta^j) - (N - 1) \tau = \phi^{kj} \eta_a \nabla_k \nabla_j v^a.$$

Using the Ricci formula, we have

$$(N - 1) \tau = 2(\nabla^a v_a - \gamma^c \nabla_c v_b).$$

From (1.25), we have

$$(3.16) \quad \tau = -\frac{2}{N + 1} \nabla_a v^a.$$

(VI). From (3.15), we have by assumption

$$v^a \nabla_a \nabla_k \eta_j + \nabla_a \eta_j \nabla_k v^a + \nabla_k \eta_a \nabla_j v^a - \eta_j \nabla_k \tau - \tau \nabla_k \eta_j = 0.$$
and from (1.10) and (1.11), we have

\[(3.17) \quad \eta_k v_j - \eta_j v_k + \phi_{aj} \nabla_k v^a + \phi_{ka} \nabla_j v^a - \eta_j \nabla_k \tau - \tau \phi_{kj} = 0.\]

Transvecting this with \(\phi^{kj}\), we have

\[(N-1) \tau = 2(\nabla_a v^a - \eta^j \nabla_a v^a).\]

From (1.25), we obtain

\[\tau = \frac{2}{N+1} \nabla_a v^a.\]

And transvecting (3.17) with \(g^{kj}\), we have

\[\eta^a \nabla_a \tau = 0.\]

and thus, the associated scalar \(\tau\) is constant along the curve tangented to direction \(\eta^j\).

Further, if \(v^j\) admits an infinitesimal strict contact transformation, then we have

\[(3.18) \quad \nabla_a v^a = 0.\]

Next, if \(v^j\) admits an infinitesimal isometry, \(v^j\) admits an infinitesimal affine collineation and \(v^j\) is strict in consequence of (1). Then we obtain (3.18).

(\(\text{IV}\)). From (3.15) and (1.11), we have by the assumption

\[(3.19) \quad \eta_k v_j - \eta_j v_k + \phi_{aj} \nabla_k v^a + \phi_{ka} \nabla_j v^a - \eta_j \nabla_k \tau - \tau \phi_{kj} = -\rho_k \eta_j - \rho_j \eta_k.\]

Transvecting this with \(\phi^{kj}\), we have from (1.25)

\[(N-1) \tau = 2(\nabla_a v^a - \tau),\]

or

\[\tau = \frac{2}{N+1} \nabla_a v^a.\]

And transvecting (3.19) with \(\eta^k \eta^j\), we obtain

\[(3.20) \quad \eta^a(\tau_a - 2\rho_a) = 0,\]
and thus, a direction $\tau_k - 2\rho_k$ is orthogonal to the direction $\eta'$. 

Next, if the transformation is strict, then it holds

\[
(3.21) \quad \rho_a \eta^a = 0,
\]

and (3.19) is reduced into

\[
\eta_k v_j - \eta_j v_k + \phi_{aj} \nabla_k v^a + \phi_{ka} \nabla_j v^a = -\rho_k \eta_j - \rho_j \eta_k.
\]

Interchanging for $k$ and $j$ and summing up these, we have

\[
\rho_k \eta_j + \rho_j \eta_k = 0.
\]

Transvecting this with $\eta^k$, we have by virtue of (3.21)

\[
\rho_j = 0,
\]

and hence, the transformation admits an infinitesimal affine collineation.

(II). From (3.15) and (1.11), we have by the assumption

\[
(3.22) \quad \eta_k v_j - \eta_j v_k + \phi_{aj} \nabla_k v^a + \phi_{ka} \nabla_j v^a = \eta_j \nabla_k \tau - \tau \phi_{kj}
\]

\[
= -\sigma_k \eta_j - \sigma_j \eta_k + \eta_a \sigma^a \xi_{kj}.
\]

Transvecting this with $\phi^{kj}$, we have

\[
2(\nabla_a v^a - \eta^a \eta^b \nabla_c v_b) = (N-1)\tau.
\]

From (1.25), it is reduced into

\[
(3.23) \quad (N+1)\tau = 2 \nabla_a v^a.
\]

On the other hand, since $v^j$ admits a conformal Killing, it holds

\[
\nabla_k v_j + \nabla_j v_k = 2\sigma \xi_{jk}.
\]

Transvecting this by $\eta^k \eta^j$ and $\xi^{kj}$ we have from (1.25) respectively

\[
(3.24) \quad \tau = \sigma,
\]

and

\[
(3.25) \quad \nabla_a v^a = N \sigma.
\]

From (3.23), (3.24) and (3.25), we have
\[ (N+1)\tau = 2N\sigma = 2N, \]

or
\[ \tau = 0 \quad \text{and} \quad \sigma = 0, \]

and thus, we have proved (10).
