20: 95~95, 1987

Erratum: "A TWO CAVITY MODEL FOR UMBRAL OSCILLATIONS"

[J. of Korean Astron. Soc., **20**, 29 (1987)]

LEE, JEONG WOO AND YUN, HONG SIK

Department of Astronomy, Seoul National University

Some mispresentation was found in Table 1 and thus the corrected Table 1 is presented together with some corrections associated with it.

Table 1. Various Proposed Models of Umbral Oscillations

Authors	Wave mode	Formation of Resonant Cavity	Weakness
Uchida & Sakurai (1975)	Alfven	Subphotospheric layer $\sim T_{min}$	No effective upward reflection for Alfven waves
Thomas & Scheuer (1982)	Fast-mode magneto-atmospheric	subphotosphere $\sim$ photosphere "Photospheric cavity"	Two small vertical velocity in the photosphere
Zhugzhda & Locans (1981)	Slow-mode magneto-acoustic	$T_{min} \sim$ transition region "Chromospheric resonator"	No correlation between the oscillation in the photosphere and chromosphere; Limited to strong field region.
Gurman & Leibacher (1984)	Pure acoustic	"Chromospheric resonator"	Weak transmission of fundamental frequency.

From the beginning of page 29, (i) "……separately." should be read as "……separately (Thomas 1984; Lites 1984; and Lites and Thomas 1985)." (ii) "……but one cavity co-existing in the sunspot atmosphere." in the second line, as "....but rather co-existing as two cavities separated by an evanescent tunneling region.", and finally (iii) "...on a single mode solution." at the end of the paragraph, as "...on a single mode solution except for TS model (Thomas and Scheuer 1982)."

The authors wish to thank Drs. John H. Thomas, Bruce W. Lites, and J. B. Gurman for bringing some of the mispresentation to attention.
