Communications to the Editor

structure, shown in Figure 1, which is based on an octadecahedron missing two adjacent vertices.

The formation of the complex I can be envisaged as the direct insertion of the metal atom above the B (5, 9, 8, 1) face of the anion with the loss of two hydrogens, followed by the rearrangement of the cage-framework. However, it is supprising that complex II is the only product of the (CO)₅ MnBr reaction since its formation requires degradation of the starting *hypho*-S₂B₇H₁₀⁻. The reaction of [Cp*RhCl₂]₂ with *hypho*-S₂B₇H₁₀⁻ also resulted in cage degradation, and gave the six-boron cluster *arachno*-7-Cp*Rh-6,8-S₂B₆H₈ III. Thus the reaction leading to the formation of the compounds involves either the direct insertion or the degradative insertion of a metal atom to the cage-framework.

The work presented here has resulted in the production of a variety of new metalladithiaborane clusters with cage framework compositions including S_2B_6 and S_2B_7 . These results also suggest that an even wider range of metalla dithiaborane clusters are possible.

- 3. In a typical experiment, a solution of Na⁺S₂B₇H₈⁻ was prepared by the reaction *in vacuo* of excess NaH (~0.1 g, 4.2 mmol) with *arachno*-6,8-S₂B₇H₉ (0.45 g, 3.0 mmol) in dimethoxyethane (~25 mL) at ~ -20°C. The solution was allowed to warm slowly to room temperature and refluxed overnight. ¹¹B-NMR spectra taken at this point confirmed the exclusive formation of *hypho*-S₂B₇H₁₀⁻. The solvent was removed *in vacuo* and the residue dissolved in 20 mL of methylene chloride. This suspension was maintained at -5°C while 5 mL of 1 M HCl in Et₂O was added. The solution was stirred for 30 min and the methylene chloride layer then filtered. Subsequent vacuum sublimation of the resulting reaction mixture gave 0.21 g (0.9 mmol) of *hypho*-S₂B₇H₁₀. This corresponds to a 67.5% yield based on consumed *arachno*-6,8-S₂B₇H₉.

Preparation of N-Carbethoxymethyl-C-alkyl(or aryl)nitrones and Their 1,3-Dipolar Cycloaddition to Alkenes

Min Hyo Seo, Han Cheol Wang, Youn Young Lee*, Yang Mo Goo⁺, and Kyongtae Kim

Department of Chemistry and [†]Department of Pharmacy, Seoul National University, Seoul 151-742

Received April 9, 1993

Nitrones are valuable synthetic intermediates and excellent 1,3-dipoles. They have been utilized for the synthesis of various nitrogen containing biologically active compounds, *e.g.*, alkaloids¹ and β -lactams². Preparation of nitrones has usually been achieved either by condensation of aldehydes with hydroxylamines³ or by oxidation of *N*,*N*-dialkylhydroxylamines⁴.

During the examination of various 1,3-dipolar cycloadducts as the possible starting materials for the construction of carbapenem skeleton, we thought that it would be interesting to develop a method for the preparation of N-carbethoxymethylnitones (2). Examination of literature did not reveal any reported method. Recently, we found that N-carbethoxyme-

thylnitrones (2) could be synthesized easily by the condensation of N-hydroxyglycine ethyl ester (1) with aldehydes. Furthermore, the nitrones reacted with various alkenes very well to give 1,3-dipolar cycloadducts in good yields. In this communication we would like to report the results.

N-Hydroxyglycine ethyl ester (1) was synthesized following the method reported by the Herscheid⁵. Reduction of ethyl *N*-hydroxyiminoacetate was achieved with 5 eq. borane-pyridine complex in 54% yield. The condensation of *N*-hydroxyglycine ethyl ester with aldehydes at refluxing benzene gave the corresponding nitrones in good yields. Thus, refluxing of *N*-hydroxyglycine ethyl ester (1) (0.28 g, 2.35 mmol) with 2,2-dimethyl-3-hydroxypropanal (0.24 g, 2.35 mmol) in benzene (10 m/) for 3 hr under nitrogen gave the nitrone 2e (0.43 g, yield 90%): ¹H-NMR (CDCl₃), δ , 1.22 (s, 1H), 1.28 (t, 3H), 3.57 (s, 2H), 4.23 (q, 2H), 4.50 (s, 2H), 4.85 (brs, 1H), 6.55 (s, 1H); IR (KBr), 3500, 1745, 1605, 1420, 1205 cm⁻¹; UV (95% EtOH), λ_{max} = 236 nm (ϵ = 36,000).

When acetaldehyde, propionaldehyde or butyraldehyde was stirred with N-hydroxyglycine ethyl ester in benzene in the presence of molecular seives 3 Å at room temperature, nitrones 2a-2c were produced in good yields also. The nitrones obtained by these methods are summarized in Table 1.

Refluxing of the *N*-carbethoxymethylnitrones (2) with alkenes in benzene gave 1,3-cycloadducts (3) in good yields. Thus, refluxing of *N*-carbethoxymethly-C-ethylnitrone (2b) (0.159 g, 1.0 mmol) with diethyl fumarate (0.344 g, 2.00 mmol) in benzene (10 m/) for 8 hr under nitrogen gave a pale green liquid after removing solvent. It was purified by chromatography on silica gel using hexane-ethyl acetate (6: 1) as an eluent to give 2-carbethoxymethyl-4,5-diethoxycarbonyl-3-ethylisoxazolidine (3a) (0.28 g, yield 84%): ¹H-NMR (CDCl₃), δ , 0.70-1.72 (m, 14H), 3.00-3.86 (m, 3H), 3.90-4.66

Table 2. Isoxazolidine derivatives (3)^o obtained from 1,3-dipolor cycloaddition of nitrones to alkenes

	R1	R²	R ³	Yield(%)	
3a	Et	CO ₂ Et	CO₂Et	84

3d	Pr	CO ₂ Et	Me	82	
3e	p-NO2CeH4	Н	CO ₂ Me	82	
3f	p-NO ₂ C ₆ H ₄	CO ₂ Me	Н	10	

"All the products gave satisfactory spectral and analytical data. ³Isolated yields.

(m, 7H), 4.87 (d, J=8.4 Hz, 1H); IR (neat), 2990, 1745, 1480, 1380, 1200, 1040 cm⁻¹. The isoxazolidine derivatives obtained by this method are summarized in Table 2.

Currently, the transformation of the 1,3-dipolar cycloadducts to carbapenem skeletons is under investigation.
