# Isolation and X-ray Structure of a Discrete FiveCoordinate $\mathrm{Na}(\mathrm{I})$ Complex Containing CpCo $\mathbf{P}\left(\mathrm{OMe}_{2}(=\mathrm{O})\right)_{3}{ }^{-}$Ligands 

Kyung Mee Kim and Jong Hwa Jeong*

> Department of Chemistry, Kyungpook National University, Taegu 702-701, Korea

Received September 6, 1996

The anionic Cobalt(III)-based oxygen tripodal ligand $\mathrm{L}_{\mathrm{OE}}$ $\left(\mathrm{L}_{\mathrm{OE}}=\left[\mathrm{CpCo}\left\{\mathrm{P}(=\mathrm{O})\left(\mathrm{OEt}_{2}\right\}_{3}\right]^{-}\right)\right.$, developed by Kläui and $\mathrm{co}^{-}$ workers, can form stable complexes with various transition metals. ${ }^{1} \mathrm{La}($ III $), \mathrm{Y}(\mathrm{III})$ complexes of $\mathrm{L}_{\mathrm{ome}}\left(\mathrm{L}_{\mathrm{OMe}}=[\mathrm{CpCo}\{\mathrm{P}\right.$ $\left.\left.\left.(=\mathrm{O})(\mathrm{OMe})_{2}\right|_{3}\right]^{-}\right)$have been studied in order to compare with middle or late transition metal complexes containing the ligand in our laboratory. ${ }^{2-3}$ Also attempts to isolate Zr ( $\left.\mathrm{L}_{\mathrm{ome}}\right)_{2} \mathrm{Cl}_{2}$ from the feasible reaction of $\mathrm{ZrCl}_{4}$ with 2 equivalent $\mathrm{NaL}_{\text {ome }}$ gave the formation of the unusual dimer in an unusual bridging fashion of tripodal ligands, $(\mathrm{L}) \mathrm{Zr}(\mathrm{L})_{2} \mathrm{Zr}(\mathrm{L})$ $\left(\mathrm{L}=\mathrm{CpCo}\left(\mathrm{P}(=\mathrm{O})(\mathrm{OMe})_{2}\right\}_{2}(\mathrm{P}(=\mathrm{O})(\mathrm{OMe})(\mathrm{O}) \mid)^{4}\right.$ in which $\mathrm{L}_{\mathrm{ome}}$ was modified by the labile chlorides at $\mathrm{Zr}\left(\mathrm{L}_{\mathrm{Ows}}\right)_{2} \mathrm{Cl}_{2}$ as an intermediate. Therefore, we tried to synthesize ( $\left.\mathrm{LOMe}_{2}\right)_{2} \mathrm{Zr}$ (amide), which would be an useful candidate for the catalyst of hydroamination of alkyne, ${ }^{5}$ by reaction of $\mathrm{Zr}\left(\mathrm{L}_{\mathrm{OMe}}\right)_{2} \mathrm{Cl}_{2}$ with excess amine. However, we isolated a discrete five-coordinate $\mathrm{Na}(\mathrm{I})$ complex containing $\mathrm{L}_{\mathrm{OMe}}$ instead of the disired product. In this paper we describe the crystal structure of the complex. Its structure is distinguishable from that of $\mathrm{Na} \mathrm{L}_{\mathrm{OE} \text { t }}$ that is a trimeric aggregate with two water molecules. ${ }^{6}$

## Experimental

All manipulations were performed under an argon atmosphere using a double manifold vacuum system and Schlenk techniques at room temperature. All solvents were purified by standard methods and were freshly dried and distilled
prior to use. $\mathrm{ZrCl}_{4}$ was purchased from Aldrich Co. and used as received, tert-Buthyl amine or diethylamine was dried over KOH and distilled under an argon atmosphere. Lome was prepared by the literature method. ${ }^{7}$
${ }^{1} \mathrm{H}$ NMR spectra were obtained in $\mathrm{CDCl}_{3}$ and referenced to internal deuterated solvent and recalculated relative to TMS on a Bruker AM-300 spectrometer. Elemental analyses were carried out by the Chemical Analysis Laboratory at Center for Scientific Instruments of Kyungpook National University.

Preparation of $\left(\mathrm{LOM}_{2}\right)_{2} \mathrm{Na} \cdot \mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3} \cdot\left[\mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}\right]$ CI. To a mixture of $\mathrm{ZrCl}_{4}(0.15 \mathrm{~g}, 0.6 \mathrm{mmol})$ and $\mathrm{NaL}_{0 \mathrm{Me}}$ ( $0.50 \mathrm{~g}, 1.2 \mathrm{mmol}$ ) 50 mL of THF was introduced. The mixture was stirred for 2 days at room temperature to afford yellow solution and white precipitate, NaCl and then $\mathrm{H}_{2} \mathrm{NC}$ $\left(\mathrm{CH}_{3}\right)_{3}(0.307 \mathrm{~g}, 4.2 \mathrm{mmol})$ was added to the mixture solution. This mixture was stirred for 1 day at room temperature. Volatile materials were removed under reduced pressure. Extraction of the solid with benzene afforded a yellow solution. The solution was concentrated and left at room temperature to yield the yellow crystalline product $(0.47 \mathrm{~g}, 70 \%)$.

Anal. Calcd for $\mathrm{C}_{30} \mathrm{H}_{70} \mathrm{ClC}_{2} \mathrm{~N}_{2} \mathrm{NaO}_{18} \mathrm{P}_{6}$ : C, 32.49; $\mathrm{H}, 6.36$. Found: $\mathrm{C}, 31.83 ; \mathrm{H}, 6.34$. ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 5.13$ (s, $\mathrm{C}_{5} \mathrm{H}_{5}$, $5 \mathrm{H}), \delta 3.73\left(\mathrm{~m},(\mathrm{MeO})_{2} \mathrm{P}(\mathrm{O})-, 18 \mathrm{H}\right), \delta 1.40\left(\mathrm{~s},\left(\mathrm{Me}_{3} \mathrm{C}, 9 \mathrm{H}\right)\right.$, $\delta 8.91$ (b, H3N-, 3H).

X-ray crystallographic analysis. An X-ray quality single crystal, $0.45 \times 0.40 \times 0.35 \mathrm{~mm}$, was mounted in a thinwalled glass capillary on an Enraf-Nonius CAD-4 diffractometer with MoK $\alpha$ radiation ( $\lambda=0.71073 \AA$ ). Unit cell parameters were determined by least-squares analysis of 25 reflections ( $18^{\circ}<2 \theta<26^{\circ}$ ). Intensity data were collected with $\theta$ range of $2.37-25.37^{\circ}$ in $\omega / 2 \theta$ scan mode. Three standard reflections were monitored every 1 h during data collection. The data were corrected for Lorentz-polarization effects and decay. Empirical absorption corrections with $\Psi$ scans were applied to the data. The structure was solved by using direct method and refined by full-matrix least-squares techniques on $\mathrm{F}^{2}$ using SHELXS-86 $6^{8}$ and SHELXL-93. ${ }^{9}$ All non-hydrogen atoms were refined by using anisotropic thermal factors except disodered C atoms of C p rings, and all hydrogen atoms were positioned geometrically and refined using riding model. The final cycle of the refinement converged with $\mathrm{R}_{1}=$ 0.055 and $w_{2}=0.129$. Crystal data, details of the data collection, and refinement parameters are listed in Table 1. Relative bond distances and angles are tabulated in Table 2.

## Results and Discussion

Reaction of $\mathrm{ZrCl}_{4}$ with 2 equivalent $\mathrm{NaL}_{o m e}$ in the THF at room temperature followed by addition of excess $\mathrm{H}_{2} \mathrm{NC}$ $\left(\mathrm{CH}_{3}\right)_{3}$, removal of precipitate and then evaporation of volatile material affords a yellow crystalline product. The 'H NMR spectrum of the product exhibits the resonances of phosphonate methyl, Cp , and tert-buthyl groups. From the integrations of the peaks for Cp rings and tert-buthyl groups we found 1:1 ratio between the two groups. It was very wondering fact that two $L_{0 M e}$ and two tert-buthyl amines were bound to Zr atom. Therefore, an X-ray crystal structure analysis was carried out. The crystal structure surprisingly shows $\mathrm{Na}(\mathrm{LoM})_{2} \mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}$ and co-crystallized $\left[\mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}\right] \mathrm{Cl}$

Table 1. Crystal data and structure refinement for ( $\left.\mathrm{LOMe}_{2}\right)_{2} \mathrm{Na} \cdot \mathrm{H}_{3}$ $\mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3} \cdot\left[\mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}\right] \mathrm{Cl}$

salt. An ORTEP drawing of the anion is shown in Figure 1.

The coordination geometry around Na atom is a highly distorted trigonal bipyramid through three oxygen atoms from one tripodal ligand and two oxygen atoms from the other tripodal ligand. $\mathrm{O}(2), \mathrm{O}(4), \mathrm{O}(5)$, and Na are found to be coplanar and with no atom displaced by more than 0.008 (3) $\AA$ from its best plane. $\mathrm{O}(1)-\mathrm{Na}-\mathrm{O}(4)$ as axis is $165.9(2)^{\circ}$. $\mathrm{O}(2)-\mathrm{Na}-\mathrm{O}(5), \mathrm{O}(2)-\mathrm{Na}-\mathrm{O}(6)$, and $\mathrm{O}(5)-\mathrm{Na}-\mathrm{O}(6)$ are $156.0(2)$, 116.4(2), and $87.6(2)^{\circ}$ respectively. $\mathrm{Na}-\mathrm{O}$ distances are similar to those in $\left(\mathrm{NaL}_{\mathrm{OE}}\right)_{3} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}{ }^{6}$ and somewhat shorter than those of $\mathrm{Na}-\mathrm{O}=\mathrm{C}$ in Na salt of dipicolinic acid ${ }^{10}$ except Na $O(6)$ which is longer than others. $O(3)$ atom is apart $3.78(5)$ $\AA$ from Na atom showing clearly not coordinating to Na . The distances between P and O atoms attached to the Na (1.476(4) to $1.498(4) \AA$ ), which are slightly longer than isolated $\mathrm{P}=0$ distance $(1.45(6) \AA$ ) in tetrahedral phosphonate compounds, ${ }^{11}$ are shorter than those between $P$ and 0 atoms bound to the methyl groups (1.586(7) to $1.634(6) \AA$ ).

On the basis of experimental, spectroscopic, and crystallographic results, the overall reaction is tentatively proposed as following equation:

$$
\begin{aligned}
& 2 \mathrm{rCl}_{4}+2 \text { NaLome } \rightarrow\left[\left(\mathrm{L}_{\mathrm{Me}}\right)_{2} \mathrm{ZrCl}_{2}+2 \mathrm{NaCl}\right] \\
& \text { excess } \mathrm{H}_{2} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3} \\
& \left(\mathrm{~L}_{\mathrm{ome}}\right)_{2} \mathrm{Na} \cdot \mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}+\mathrm{NaCl}+3 \\
& {\left[\mathrm{H}_{3} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3} \mathrm{Cl}+\left[\mathrm{Zr}\left[\mathrm{NHC}_{2}\left(\mathrm{CH}_{3}\right)_{3}\right]_{4}\right]\right.}
\end{aligned}
$$

Figure 1. ORTEP Drawing of [(Lome $\left.)_{2} \mathrm{Na}\right]^{+}$with $50 \%$ probability displacement elipsoide. Hydrogen atoms are omitted for clarity.

To our knowledge, this is the first example of discrete fivecoordinate $\mathrm{Na}(\mathrm{I})$ complexes containing $\left.\mathrm{CpCo} \mid \mathrm{P}(\mathrm{OR})_{2}(=0)\right\}_{3}$ ligands. An interesting feature of the structure is that one tripodal ligand binds to Na ion as tridentate and another
one binds to that as bidentate. Otherwise, $\left[\mathrm{Zr}\left(\mathrm{L}_{\mathrm{OMe}}\right)_{2} \mathrm{Cl}_{2}\right]$ reacts with excess $\mathrm{HN}(E t)_{2}$ in stead of $\mathrm{H}_{2} \mathrm{NC}\left(\mathrm{CH}_{3}\right)_{3}$ in the presence of NaCl to afford $\left[\left(\mathrm{L}_{\mathrm{OMe}}\right)_{2} \mathrm{Na}\right]-\left[\mathrm{H}_{2} \mathrm{~N}(\mathrm{Et})_{2}\right]^{+}$as the similar results ${ }^{12}$ except the fact that alkylamonium chloride salt was co-crystallized.
