# Preparation and Structure of trans,cis-[ $\left.\operatorname{ReCl}_{2}\left(\mathrm{~N}_{-} \mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}-\mathrm{O}, O^{\prime}\right)\right]$ 

Nam-Sun Choi and Soon W. Lee ${ }^{*}$<br>Department of Chemistrv, Sungkyunkwan Unwersity, Natural Science Campus, Suwon 440-746, Korea Recened February 8. 2000

Transition-metal imido (or nitrene, $\mathrm{M}=\mathrm{NR}$ ) complexes have attracted continuous interest. ${ }^{1.8}$ We have been continuously interested in Re -imido complexes ( $\mathrm{Re}=\mathrm{NR}$ ). For example, we recently prepared several Re-imido complexes of the type $\operatorname{Re}(\mathrm{NAr})\left(\mathrm{PR}_{3}\right)_{2} \mathrm{Cl},\left(\mathrm{PR}_{3}=\mathrm{PMe}_{3}, \mathrm{PEt}_{3}, \mathrm{P}(\mathrm{OMe})_{3} ; \mathrm{Ar}_{6}=\mathrm{C}_{6} \mathrm{H}_{5}\right.$, 2.6-i- $\left.\mathrm{Pr}_{2}-\mathrm{C}_{6} \mathrm{H}_{3}\right)$ from the reactions of $\operatorname{Re}\left(\mathrm{N}-\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2}-$ $\mathrm{Cl}_{:}(\mathrm{py})$ (1) with small phosphines or phosphites. ${ }^{9}$ The products were remarkably inert to carbon nucleophiles ( $\mathrm{ZnR} \mathrm{R}_{2}: \mathrm{R}$ $=\mathrm{Me}, \mathrm{Et} ; \mathrm{AlR}_{3}: \mathrm{R}=\mathrm{Me}, \mathrm{Et} ; \mathrm{RMgBr}: \mathrm{R}=\mathrm{Me}, \mathrm{Et} ; \mathrm{M}{ }^{\prime} \mathrm{Cp}: \mathrm{M}^{\prime}$ $\left.=\mathrm{Li}, \mathrm{Na}, \mathrm{TI} ; \mathrm{NaCp}^{*}\right)$ and hydrides ( $\left.\mathrm{LiBEt}_{3} \mathrm{H}, \mathrm{LiBEt}_{3} \mathrm{D}\right)$.

Reactions of transition-metal oxo or imido complexes with hydrogen halides are known to proceed by protonation of the named ligand and substitution by halide ions, generally without change in the oxidation state of the metal. ${ }^{1.5}$ There have been only a very few reports on the reaction of the imido complex with an organic acid. ${ }^{5}$ for instance, the $\operatorname{Re}(V)$ imido complex, mer,trons- $\mathrm{ReMe}_{3}\left(\mathrm{PMe}_{3}\right)_{2}(\mathrm{NPh})$, reacts with acetic acid $\left(\mathrm{CH}_{3} \mathrm{COOH}, \mathrm{AcOH}\right)$ to give cis, $\mathrm{rrans}-\mathrm{Re}(\mathrm{AcO})_{2}-$ $\left(\mathrm{PMe}_{3}\right)_{2} \mathrm{Me}(\mathrm{NPh})(\mathrm{eq} 1) .{ }^{16}$ We set out the reaction of $\operatorname{Re}(\mathrm{N}-$ $\left.\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl}_{3}(\mathrm{py})$ (1) with benzoic acid ( PhCOOH ) to check the reactivity of the Re-imido complex toward an aromatic carboxylic acid. Herein we report the preparation and structure of $\left[\mathrm{ReCl}_{2}\left(\mathrm{~N}-\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}-\mathrm{O}, \mathrm{O}^{\circ}\right)\right]$ (2).

## Experimental Section

Unless otherwise stated, all the reactions have been performed with standard Schlenk line and cannula techniques under an argon atmosphere. Air-sensitive solids were manipulated in a glove box filled with argon. Glassware was soaked in KOH-saturated 2-propanol for ca. 24 h and washed with distilled water and acetone before use. Glassware was either flame-dried or oven-dried. Hydrocarbon solvents were stirred over concentrated $\mathrm{H}_{2} \mathrm{SO}_{4}$ for ca. 48 h , neutralized with $\mathrm{K}_{2} \mathrm{CO}_{3}$, stirred over sodium metal, and distilled by vacuum transfer. Benzene was distilled over sodium metal under Ar. Benzoic acid ( PhCOOH ) was distilled under Ar , degassed by freeze-pump-thaw cycles, and stored under Ar . $\mathrm{Re}\left(\mathrm{N}_{-} \mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl}_{3}(\mathrm{py})$ (1) was prepared by the literature method. ${ }^{1112}$
${ }^{1} \mathrm{H}$ - and $\left.{ }^{13} \mathrm{C} \cdot{ }^{1} \mathrm{H}\right\}-\mathrm{NMR}$ spectra were recorded with a Bruker AMX 500 MHz spectrometer with reference to inter-

[^0]nal solvent resonances and reported relative to tetramethylsilane. IR spectra were recorded with a Nicolet 205 FIIR spectrophotometer. Melting points were measured with a Thomas Hoover capillary melting point apparatus without calibration. Elemental analyses were performed by the Korea Basic Science Center.

Preparation of $\mid \mathrm{ReCl}_{2}\left(\mathrm{~N}^{-} \mathrm{C}_{6} \mathrm{H}_{3} \mathbf{- 2 , 6 - i}-\mathrm{Pr}_{2}\right)_{\mathbf{2}}\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}{ }^{-}\right.$ $\left.\left.O_{0} \boldsymbol{O}^{\prime}\right)\right]$ (2). A deep green solution of $\mathbf{1}(0.35 \mathrm{~g}, 0.485 \mathrm{mmol})$ and benzoic acid ( 0.06 g .0 .485 mmol ) in benzene ( 30 mL ) was refluxed for 12 h to give a deep brown solution. The resulting solution was filtered, and the solvent was removed under vacuum to give a black brown oil. The oil was washed with hexane ( $20 \mathrm{~mL} \times 3$ ) and dried under vacuum to obtain $0.17 \mathrm{~g}\left(48 \%\right.$ Ist crop yield) of $\left[\mathrm{ReCl}_{2}\left(\mathrm{~N}_{-} \mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2}-\right.$ $\left.\left(\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}-\mathrm{O}, \mathrm{O}^{\prime}\right)\right]$ (2). The hexane washings were concentrated under vacuum and then stored at $-25^{\circ} \mathrm{C}$ to give brown-black crystals. These crystals were washed with cold hexane ( $10 \mathrm{~mL} \times 2$ ) and dried under vacuum to obtain additional $0.08 \mathrm{~g}(23 \%$ 2nd crop yield, total yield $71 \%)$ of 2 . The product was recrystallized from hexane.
${ }^{1} \mathrm{H}$ NMR (CDCli3): $\delta 8.209$ ( 1 H, d, ortho- H in benzoate), 8.101 ( 1 H, d, ortho-H in benzoate). 7.626 (IH, m. para- $H$ in benzoate), 7.485 ( $2 \mathrm{H}, \mathrm{m}$, meta- H in benzoate), 7.365-7.113 $\left(6 \mathrm{H}, \mathrm{m}\right.$, imido phenyl), $3.922\left(2 \mathrm{H}\right.$, sept, diastereotopic $\left.\mathrm{C} H \mathrm{Me}_{2}\right)$, $3.461\left(2 \mathrm{H}\right.$, br, diastereotopic $\left.\mathrm{CH} \mathrm{Me}_{2}\right) .1 .281(12 \mathrm{H}$, d. diastereotopic $\mathrm{CHMe}_{2}$ ), 1.242 ( $12 \mathrm{H}, \mathrm{d}$, diastereotopic $\mathrm{CH} \mathrm{Me}_{2}$ ). $\left.{ }^{1.3} \mathrm{C}_{1}^{1} \mathrm{H}\right\}-\mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 183.503\left(\mathrm{CO}_{2}\right), 152.369-123.371$ (phenyl), $29.349\left(\mathrm{CHMe}_{2}\right), 29.109\left(\mathrm{CHMe}_{2}\right), 26.011\left(\mathrm{CHMe}_{2}\right)$, $24.575\left(\mathrm{CHMC}_{2}\right)$. X-ray Structure Determination. All X-ray data were collected with use of a Siemens P 4 diffractometer equipped with a Mo X-ray tube and a graphite crystal monochromator. Details on crystal data and intensity data are given in Table 1. The orientation matrix and unit cell parameters were determined by least-squares analyses of the setting angles of 49 reflections in the range $15.0^{\circ}<2 \theta<25.0^{\circ}$. Three check reflections were measured every 100 reflections throughout data collection and showed no significant variations in intensity. Intensity data were corrected for Lorenz and polarization effects. Decay corrections were also made. The intensity data were empirically corrected with psi-scan data. All calculations were carried out with use of the Siemens SHELXTL programs. ${ }^{1,7}$

A yellow crystal of 2 , shaped as a block, of approximate dimensions $0.08 \times 0.12 \times 0.20 \mathrm{~mm}^{3}$, was used for crystal

and intensity data collection. The unit cell parameters indicated the triclinic unit cell with the two possible space groups: $\overline{P 1}$ and $P$ 1. A statistical analysis of reflection intensities suggested a centrosymmetric space group, and the structure analysis converged only in $\overline{P 1}$. The structure was solved by the direct method and retined by full-matrix least-squares calculations of $F^{2}$ s, initially with isotropic and finally anisotropic temperature factors for all non-hydrogen atoms. All hydrogen atoms were generated in idealized positions and refined in a riding model.

Final atomic positional parameters are shown in Table 2. The selected bond distances and bond angles are shown in Table 3.

## Results and Discussion

Preparation. Compound 1, a bis(imido) Re(VII) complex. reacts with benzoic acid $(\mathrm{PhCOOH})$ in retluxing benzene to give a Re-imido benzoato compound. $\left[\mathrm{ReCl}_{2}\left(\mathrm{~N}-\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\right.\right.$ $\left.\left.\mathrm{Pr}_{2}\right)_{2}\left(\mathrm{C}_{6} \mathrm{H}_{3} \mathrm{CO}_{2}-\mathrm{O}, \mathrm{O}^{\circ}\right)\right]$ (2), in $70 \%$ yield (eq 2). One chloro and one pyridine (py) ligands have been displaced by the chelating benzoato ligand during the reaction. The two imido (NAr) ligands have remained intact, and there has been no change in the formal oxidation state of the Re metal. Com-

pound 2 is air- and moisture-stable both in solution and in the solid state.
In ${ }^{1} \mathrm{H}$ NMR spectra of $\mathbf{2}$, methynyl protons ( $\mathrm{C} / / \mathrm{Me}_{2}$ ) in the isopropyl substituents show two septets at $\delta 3.922$ and 3.461 ppm , due to their diastereotopic relationship. The methyl protons ( $\mathrm{CHM} \mathrm{C}_{2}$ ) in the isopropyl substituents also exhibit diastereotopic relationship and appear as two doublets at $\delta$ 1.281 and 1.242 ppm . The diastereotopic relationship also appears in ${ }^{1.3} \mathrm{C}\left\{{ }^{\prime} \mathrm{H}\right\}-$ NMR spectra of 2 . The IR band at 1451 $\mathrm{cm}^{-1}$ can be assigned to the $\mathrm{C}=\mathrm{O}$ bond in the benzoato ligand.

Structure. The molecular structures of 2 with the atomic numbering scheme appears in Figure 1. Compound 2 has two chloro ligands, one $\eta^{2}$-benzoato ( $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CO}_{2}-\mathrm{O}, \mathrm{O}^{\prime}$ ), and two imido $\operatorname{NAr}$ ( $\mathrm{Ar}=2,6$-diisopropylphenyl) ligands. The coordination sphere of Re can be described as a distorted octahedron in which the two NAr ligands are mutually cis. The two CI liagnds are trans to each other, and each NAr ligand is trans to the oxygen atom ( O 1 or O 2 ) in the betoato ligand. The equatorial planed, defined by $\mathrm{N} 1, ~ \mathrm{~N} 2 . \mathrm{O} 1, \mathrm{O} 2$, and Re1, is nearly planar with the average atomic displacement of $0.0112 \AA$. With respect to the equatorial plane, the two imido aryl planes in the NAr ligands have dihedral angles $45.5(5)^{\circ}$ and $12.5(7)^{\circ}$. The bezoate phenyl ring (C26-C30) is nearly parallel to the equatorial plane with a dihedral angle of $5.9(7)^{\circ}$.
The Rel-N1-C1 and Re1-N2-C13 bond angles (172.3(9)", $\left.174.6(9)^{\circ}\right)$ and the Re-N1 and Rel-N2 bond distances $(1.707(8) \AA, 1.742(12) \AA$ ) are fairly typical of aryl imido ligands in high oxidation state Re complexes. ${ }^{5}$ These angles and distances indicate that the Reimido groups ( $\mathrm{Re}-\mathrm{N}-\mathrm{R}$ ) in $\mathbf{2}$ are linear and the $\mathrm{Re}-\mathrm{N}$ bonds have a triple bond character with an $s p$-hybrid nitrogen.

Carboxylic acids usually behave as monoanionic oxygendonor ligands. Although the division may not be sharply distinct. three coordination modes of the carboxylic acids have been identified: monodentate, chelating, and briging. ${ }^{14}$ Symmetrically chelating coordination is less common than monodentate coordination. The two Re-O bond distances (RelOI: $2.160(8) \AA$; Rel-O2: $2.162(9) \AA$ ) are essentially the same, suggesting the symmetrically chelating coordination of the benzoato ligand.
In summary, we have prepared a $\operatorname{Re}(\mathrm{VII})$-imido benzoato compound, $\left[\mathrm{ReCl}_{2}\left(\mathrm{~N}-\mathrm{C}_{6} \mathrm{H}_{3}-2,6-i-\mathrm{Pr}_{2}\right)_{2}\left(\mathrm{C}_{6}, \mathrm{H}_{5} \mathrm{CO}_{2}-\mathrm{O}, \mathrm{O}^{\prime}\right)\right]$ (2), by treating $\operatorname{Re}\left(\mathrm{N}_{-} \mathrm{C}_{6} \mathrm{H}_{5}-2,6-i-\mathrm{Pr}_{2}\right)_{2} \mathrm{Cl} l_{3}(\mathrm{py})$ (1) with benzoic acid in a stoichiometic manner. In this reaction, the benzoato ligand has displaced one chloro and one pyridine (py) ligands. Compound 2 has been characterized by NMR and IR spec-

Figure I. ORTEP drawing of 2 showing the atom-labeling scheme and $50 \%$ probability thermal ellipsoids.
troscopy, and its molecular structure has been determined by X -ray diffraction.
