= Abstract =

Usefulness of Hypothermia Treatment in Patients with Increased Intracranial Pressure

Jong Moo Lee, M.D., Jae Sung Ahn, M.D., Jeong Hoon Kim, M.D., Chang Jin Kim, M.D., Yang Kwon, M.D., Jung Kyo Lee, M.D., Byung Duk Kwun, M.D., Sang Ryong Jeon, M.D.

Department of Neurological Surgery, Asan Medical Center, College of Medicine, University of Ulsan, Seoul, Korea

bjective: The goal of this study is to evaluate the usefulness of mild hypothermia treatment in patients with

increased intracranial pressure(ICP).

Material and Method: From November 1999 to May 2001, 11 patients were treated with mild hypothermia (32 - 34) in whom ICP maintained at higher than 20mmHg in spite of decompressive surgery and high dose barbiturate therapy. The patients' rectal temperature were lowered by external cooling. Hypothermia was maintained for not more than 7 days and then the patients were rewarmed slowly for 24 hours. If increased ICP persisted for 2 days of hypothermia, this treatment was continued for several days. The functional outcome of each patient was assessed according to Glasgow Outcome Scale(GOS).

Results: All cases except two cases showed decrease of ICP after hypothermia therapy. In 1 case which was right middle cerebral artery(MCA) infarct, ICP re-increased after 24 hours and in another 1 case, ICP was not controlled initially. Among 11 cases, 3 cases showed favorable outcome.

Conclusion: Mild hypothermia treatment in patients with increased ICP was effective in controlling ICP and mortality was so decreased. More clinical experience and controlled study was need to determine the effectiveness.

 $K\!E\!Y\ WORDS$: Mild hypothermia \cdot Increased intracranial pressure.
