# Synthesis and X -ray Structure of $\mathbf{Z n}($ bpeae $) \mathrm{ZnCl}_{3}$ (bpeae $=\mathbf{2 - \{ B i s - [ 2 - ( 3 , 5 - d i m e t h y l - p y r a z o l - 1 - y l ) - e t h y l | a m i n o \} e t h o x y ) ~}$ 

Jong Hwa Jeong, Yeon Do Park, and Soo-Gyun Roh<br>Department of Chemisty. Kymppook National Lniversity, Daegu 702-701, Korea Received Febraay 11, 2003

Key Words: Dinuclear 7n complex, Clatom transfer, Annono ethoxy ligand, X-ray dilfraction analysis

Coordination chemistry of zinc with chelate ligands containing nitrogen and/or oxygen donors is of considerable interest as a model of enzymes such as carbonic anhydrase [NNN] ${ }^{1}$ and thermolysin [NNO]. ${ }^{-}$A variety of coordination possibilities such as the variability and flexibility of functional ligands in relevant coordination spheres for zinc could provide highly interesting reactions, structures and catalyst chemistry. ${ }^{3}$

Although transition metal complexes of the ligands. bis[(py razol-l-yl)ethyl]amine (bpea) ${ }^{4-6}$ bis[2-(3.5-dimethyl-1-pyrazolyl)etlyl]ether ${ }^{-\sqrt{6}}$ and bis[2-(3.5-dimethyl-1-pyrazolyl)ethyllsulfide ${ }^{6}$ having commonly three-coordinated Tshape. $\mathrm{N}_{3}$-donor ligand are known, the zinc complexes of their ligands were still limited. ${ }^{\text {ta., fl. }, \text { td }}$ We have focused on the design and synthesis of $\hat{y}$-substituted pyrazole derivative ligand in order to gain better understandings of the controlling electronic effects and coordination numbers from the reaction of those ligands with $\mathrm{ZnCl}_{2}$ in a structural model of trigonal-by pramidal $\mathrm{Cl}_{2} \mathrm{ZnN}_{3}$ or $\mathrm{ClZnN}_{3} \mathrm{O}$ complex.
Herein, we report the synthesis and structural properties of the $\mathrm{Zn}(11)$ complex of the bpeae as a new type of tetradentate ligand.

## Experimental Section

All chemicals were all reagent-grade and all solvents were freshly distilled prior to use. The bpea was prepared as described in the literature. ${ }^{-1, \ldots a}{ }^{1} \mathrm{H}$ NMR spectra were obtained with a Varian 300 -NMR Spectrometer at ambient temperature and chemical shifts were referenced to internal tetramethy Isilane. Elemental analyses were performed at the Chemical Analysis Laboratory of Center for Scientific Instruments in Kyungpook National University:
2-\{Bis-[2-(3,5-dimethyl-pyrazolyl-1-yl)-ethyl]amino\}cthanol (bpeacH). To the solution of bpea (7.03 g. 26.9 munol) in acetone ( 70 mL ) was added slowly 2-bromoethanol ( 5.01 mL .67 .2 mmol ) and subsequently triethylamine ( $9.34 \mathrm{~mL}, 67.2 \mathrm{mmol}$ ) with stirring at room temperature. The solution was refluxed for 2 weeks and then the resulting solution was filtered, dried and extracted with dichloromethane, washed four times with brine, dried with $\mathrm{MgSO}_{4}$ and exaporated in vacto to afford a yellow oil. Yield: $5.01 \mathrm{~g}(61 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 5.68(\mathrm{~s}, ~+-/ /-\mathrm{Pz})$. $3.76\left(\mathrm{t} . \mathrm{NCH}_{-} \mathrm{C} I I_{2}-\mathrm{Pz}, J=6.3 .6 .3 \mathrm{~Hz}\right) .3 .48\left(\mathrm{t}, \mathrm{NCH}_{2} \mathrm{C} / I_{2} \mathrm{OH}\right.$, $J=4.5,4.8 \mathrm{~Hz}), 2.80\left(\mathrm{t}, ~ \mathrm{NC} / I_{2} \mathrm{CH}_{-}-\mathrm{Pz}, J=6.3 .6 .3 \mathrm{~Hz}\right) .2 .62$
(t. $\left.\mathrm{NC}_{2} I_{2} \mathrm{CH}_{2} \mathrm{OH} . J=4.8 .4 .8 \mathrm{~Hz}\right) .2 .12\left(\mathrm{~s}, \mathrm{C} I_{3}-\mathrm{Pz}\right) .2 .08(\mathrm{~s}$. $\mathrm{C} / \mathrm{H}_{3}-\mathrm{Pz}$ ).
$\left[\mathbf{Z n}\right.$ (bpeac) $\left.\left(\mathbf{Z n C l}_{3}\right)\right] \cdot \mathbf{C H}_{2} \mathbf{C l}_{\mathbf{2}}$. To a suspension of NaH ( 0.163 g .6 .50 mmol ) in dry THF was added a solution of bpeaeH ( 1.97 g .6 .45 mmol ) in THF. The misture was refluxed for 1 day and the resulting suspension gradually conserted into a yellow clear solution. To the resulting solution was added a solution of $\mathrm{ZnCl}_{2}(1.76 \mathrm{~g} .12 .90 \mathrm{mmol})$ in methanol ( 25 mL ) and was precipitated a white solid after several munutes. The mixture was stirred for 1 day at ambient temperature the solution was filtered and the solvent was removed in vacuo to give a white solid. The product was washed with ether and dried in wacuo. The recrystallization of a white solid in dichloromethane gave colorless crystals within a week. Yield: $1.8 \mathrm{~g}(51 \%)$. Anal. Calcd. for $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{Cl}_{3} \mathrm{~N}_{5} \mathrm{OZn}_{2} . \mathrm{CH}_{2} \mathrm{Cl}_{2}:$ C. $32.59: \mathrm{H} .4 .50: \mathrm{N}$. 11.18. Found: C. 32.53: H. 4.59: N, 11.11. ${ }^{1} \mathrm{H}$ NMR (DMSO-d ${ }_{6}$ ): $\delta 5.72(\mathrm{~s}, 4-/ /-\mathrm{Pz}), 3.80\left(\mathrm{t} . \mathrm{NCH}_{2} \mathrm{C} / I_{2}-\mathrm{Pz}, ~ J=\right.$ $6.6,6.9 \mathrm{~Hz}) .3 .35\left(\mathrm{t}, \mathrm{NCH}_{2} \mathrm{C} / I_{2} \mathrm{O}, j=6.0,5.7 \mathrm{~Hz}\right) .2 .75(\mathrm{t}$. $\left.\mathrm{NC} / I_{-} \mathrm{CH}_{2}-\mathrm{Pz} . X-ray Structure Determination. A colorless single crystal of the title complex suitable for X-ray structural analysis crystallized in dichloromethane solutions was mounted on an Enraf-Nonius CAD-4 diffractometer with Mo-K $\alpha_{\alpha}$ radiation ( $\lambda=0.71073 \AA$ ). Unit-cell dimensions with estimated standard deviations were determined by least-squares using 25 wellcentered reflections. A total of +725 unique reflections were collected in the $\theta$ range of $1.78-27.87^{\circ}(0 \leq h \leq 11 .-21 \leq k \leq$ $0 .-19 \leq 1 \leq 19$ ). The intensities of reflections were corrected for Lorentz and polarization effects. Crystal data. data collection, and refinement for the complex are listed in Table 1. Data reduction was carried out with a Molen program package and empirical absorption corrections were applied based on $\Psi$ scans. The stnicture in $/ 2_{1} / c$ was determined by direct methods and refined by full-matrix least-squares using SHELXS-97 and SHELXL-97 program packages ${ }^{*}$ with reflections with $I>2 \sigma(I)$. All non-hydrogen atoms were refined anisotropically. Hy drogen atoms were constrained by using riding modes. The final cycle of the refinement yielded to $R=0.037 . n R=0.113$. Selected bond distances and bond angles are given in Table 2.

Crystallographic data for the structure reported here have been deposited with the Cambridge Crystallographic Data Center (Deposition No. CCDC-191169). ## Results and Discussion

The tetradentate ligand bpeae was readily afforded from the reaction of bpea with 2-bromoethanol and triethy lamine in refluxing acetone at $1: 2.5: 2.5$ ratio for 2 weeks. Nucleophilic attack of the nitrogen atom of bpea at the

Figure 1. Crystal structure with the labeling scheme for [7n(bpeae) ( $\mathrm{ZnCl} \mathrm{Cl}_{3}$ )
carbon atom of bromoethanol took place through the liberation of HBr . which was precipitated by triethylamine. $\mathrm{Zn}(\mathrm{II})($ bpeae $)\left(\mathrm{ZnCl}_{3}\right)$ was afforded from the reaction of $\mathrm{ZnCl}_{2}$ with the Na salt of bpeae as white crystals after usual workups. The compound is soluble in methanol and most chlorinated solvents and not soluble in etherated solvents. ${ }^{1} \mathrm{H}$ NMR spectrum shows all of the peaks as shown in the spectrum of the free ligand. The X-ray diffraction analysis was carried out to explore the structure of the compound as shown at Figure 1. The compound is a dinuclear zinc complex containing one bpeae ligand and three chloro ligands. The central atom $\mathrm{Zn}(1)$ at Figure 1 is in a distorted tetrahedral coordination geometry surrounded by two nitrogen atoms of two pyrazoles, one nitrogen atom of amine and one oxygen atom of ethanolate of bpeae. while the central atom $\mathrm{Zn}(2)$ is in a distorted tetrahedral coordination geometry consisting of one bridging oxygen atom of ethanolamine of bpeae and three chloro atoms. We can postulate the mechanism for the formation of compound that an oxygen atom of ethanolamine of bpeae at the first proposed product $[\mathrm{Zn}(\mathrm{bpeae}) \mathrm{Cl}]$ coordinates to the second $\mathrm{ZnCl}_{2}$ accompanying chloro atom transfer to give $\left[\mathrm{Zn}(\right.$ bpeae $\left.) \mathrm{ZnCl}_{3}\right]$ (see Scheme 1). The bond distances of $\mathrm{Zn}-\mathrm{N}(+)$ and $\mathrm{Zn}-\mathrm{N}(1)$ are 1.896 (3). $1.985(3) \mathrm{A}$. which are somewhat shorter than those observed in related compounds of the type $\mathrm{Zn}(\mathrm{L}-\mathrm{L})=$. i.e.. 2.002(5)-2.007(5) A with L-L being $\mathrm{H}_{2} \mathrm{~B}\left(3.5-\mathrm{Me}_{2} \mathrm{Pz}\right)_{2}, 2.01+(3)-2.039(3) \mathrm{A}$ with $\mathrm{L}-\mathrm{L}$ $\mathrm{H}_{2} \mathrm{~B}\left[3,5-\left(\mathrm{CF}_{3}\right)_{2} \mathrm{P}_{2}\right]_{-} 2.029(3)$ and $2.157(3) \mathrm{A}$ in $\mathrm{ZnCl}_{2}$ (Clemizole). ${ }^{1 i}{ }^{2.006(3)}$ and $2.008(3) \mathrm{A}$ in $\mathrm{ZnCl}_{2}(1.2-$ dimethy limidazole) $2^{11}$ and 2.050 (3) and 2.074 (3) A in $\mathrm{ZnCl}_{2}$ (quinoline) ${ }^{12}$ However $\mathrm{Zn}-\mathrm{N}(3) .2 .170$ (3) A. is similar to those in the above related compounds. The bond distances $\mathrm{Zn}(2)-\mathrm{Cl}$ [average 2.243 (1) A] are also in accord with those of the related complexes. which are in the range of $2.196(2)-$ $2.251(1) \mathrm{A}^{1-1.5}$ The distance between $\mathrm{Zn}(1)$ and $\mathrm{Cl}(3)$ is 2.997(2) A showing a little interaction. The bond distances of $\mathrm{Zn}(1)-\mathrm{O}$ and $\mathrm{Zn}(2)-\mathrm{O}$ are 2.017(3) and 1.930(3) A in

Scheme 1
which the oxygen atom was bridged between $\mathrm{Zn}(1)$ and $\mathrm{Zn}(2)$. These distances are somewhat shorter than those [2.062(2) and $2.058(2) \mathrm{A}]$ in $\left[\mathrm{Zn}\left\{\mathrm{O}=\mathrm{C}(\mathrm{Me}) \mathrm{CH}_{2} \mathrm{C}(\mathrm{Me})_{2} \mathrm{OH}_{\}}\right]\right.$ $\left.\left[\mathrm{ZnCl}_{1}\right]\right]^{1+}$ The bond angle of $\mathrm{Zn}(1)-\mathrm{O}-\mathrm{Zn}(2)$ is $114.3^{\circ}$. The bond angles $\left[1+2.3(1)^{\circ}\right]$ of $\mathrm{N}(1)-\mathrm{Zn}(1)-\mathrm{O}$ results in the distortion from an ideal tetrahedral geometry as a consequence of the opening due to the steric repulsion of methyl groups of pyrazole. In conclusion. a new dinuclear Zn complex with the bridging oxygen atom of alkoxide was synthesized accompanying one Cl atom transfer.
