Key Words: Rhenium, Octahedral cluster, Tellurobromide, Crystal structure

Whereas $\mathrm{Re}_{6}$ octahedral thio- and selenium halide clusters are well known ${ }^{14}$ only few examples of tellurium halide clusters are known. ${ }^{5-8}$ The known data have demonstrated that there is essential difference in the compositions and structures of chalcohalides containing cluster core $\left\{\operatorname{Re}_{6} \mathrm{Q}_{8}\right\}$ for $\mathrm{Q}=\mathrm{Te}$ compounds and $\mathrm{S} / \mathrm{Se}$ derivatives. Earlier it was shown that in the compounds with cluster core $\left\{\operatorname{Re}_{6} \mathrm{Q}_{8}\right\}$ often Te-rich compounds are formed in which Re atoms are coordinated by Te atoms of different unusual ligands such as neutral $\mathrm{Te}_{6}$ and $\mathrm{TeCl}_{3}{ }^{-}$found in $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Cl}_{6}, \mathrm{Te}_{16} \mathrm{Cl}_{18}{ }^{2-}$ in $\operatorname{Re}_{6} \mathrm{Te}_{16} \mathrm{Cl}_{18}{ }^{6}$ or $\mathrm{TeCl}_{2}$ in $\mathrm{Re}_{6} \mathrm{Te}_{6} \mathrm{Cl}_{10}$ and $\mathrm{TeBr}_{2}$ in $\mathrm{Re}_{6} \mathrm{Te}_{14} \mathrm{Br}_{14} \cdot{ }^{7}$ As is evident from these data the chemistry of cluster rhenium tellurobromides is poorly understood. In this work we have continued the study of $\mathrm{Re}-\mathrm{Te}-\mathrm{Br}$ system and prepared a new tellurobromide $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$.
The title compound, $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$ is isostructural to known $\operatorname{Re}_{6} \mathrm{Te}_{16} \mathrm{Cl}_{6}{ }^{6}{ }^{6}$ It may be described as $\left[\left\{\mathrm{Re}_{6} \mathrm{Te}_{8}\right\}\left(\mathrm{Te}_{6}\right)\left(\mathrm{TeBr}_{3}\right)_{2}\right]$ where cluster cores $\left\{\operatorname{Re}_{6} \mathrm{Te}_{8}\right\}$ are joined together by neutral $\mathrm{Te}_{6}$ and $\left[\mathrm{TeBr}_{3}\right]^{-}$ligands. The cluster core $\left\{\mathrm{Re}_{6} \mathrm{Te}_{8}\right\}$ has a crystallogrophically imposed twofold axes. The bond lengths and angles in cluster core are similar to those observed in others compounds with $\left\{\mathrm{Re}_{6} \mathrm{Te}_{8}\right\}$ cluster core. In $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$

Figure 1. Structure of $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$ viewed along [001]. Displacement ellipsoids are drawn at the $75 \%$ probability level.
two rhenium atoms at opposite vertices of the $\mathrm{Re}_{6}$ octahedron are capped by $\left[\mathrm{TeBr}_{3}\right]^{-}$ligands (Fig. 1). The four remaining Re atoms are capped with neutral $\mathrm{Te}_{6}$ ligands. The $\mathrm{Te}_{6}$ ligands have a chair conformation as in $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Cl}_{6}$ and recently described $\left(\mathrm{AgI}_{2}\right)_{2} \mathrm{Te}_{6} .{ }^{9}$ In $\mathrm{Te}_{6}$ units $\mathrm{Te}-\mathrm{Te}$ bond lengths are ranging from $2.770(2)$ to $2.930(2) \AA$ in the title compound, from 2.762(4) to 2.899(5) $\AA$ in $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Cl}_{6}$ and equal to $2.729(1)$ and $2.760(1) \AA$ in $\left(\mathrm{AgI}_{2}\right)_{2} \mathrm{Te}_{6}$. In the present structure each $\mathrm{Te}_{6}$ species are chelated four $\mathrm{Re}_{6} \mathrm{Te}_{8}\left(\mathrm{TeBr}_{3}\right)_{2}$ clusters ( $\mathrm{Re}-\mathrm{Te}$ distances are 2.6567(13)$2.7166(13) \AA$ ) forming a two-dimensional network (Fig. 2). The four Re -bound Te atoms of the $\mathrm{Te}_{6}$ chair are coplanar. The $\mathrm{Te}-\mathrm{Br}$ bond lengths in the $\left[\mathrm{TeBr}_{3}\right]^{-}$ligands are 2.574(2), $2.585(2)$ and $2.969(2) \AA$. The Br atom that forms the longer $\mathrm{Te}-\mathrm{Br}$ bond interacts further with $\mathrm{Te}^{2+}$ center of a $\left[\mathrm{TeBr}_{3}\right]^{-}$ ligand from an adjacent layer, creating a square-planar geometry around the $\mathrm{Te}^{2+}$ center $\left(\mathrm{Br}_{3} \mathrm{Te} \cdots \mathrm{Br}\right.$ distance is equal to $3.024(2) \AA, \mathrm{Br}-\mathrm{Te}-\mathrm{Br}$ angles are in the range 84.755(7) $\left.{ }^{\mathrm{o}}-94.56(7)^{\circ}\right)$.

## Experimental Section

Synthesis. The title compound was prepared by the reaction of $\mathrm{Re}_{6} \mathrm{Te}_{15}$ with elemental Te and $\mathrm{Br}_{2}$ taken in molar

Figure 2. Structure of $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$ viewed along [100]. Displacement ellipsoids are drawn at the $75 \%$ probability level.

Table 1. Selected bond length $(\AA)$ and angles $\left({ }^{\circ}\right)$

| Bond | length ( $\AA$ ) | Bond | length ( $\AA$ ) |
| :---: | :---: | :---: | :---: |
| Re1-Te3 | 2.6761(12) | Re3-Te3 ${ }^{i}$ | 2.6567(13) |
| Re1-Re2 | 2.6849(10) | Re3-Te1 | $2.6590(12)$ |
| Re1-Re3 | $2.6880(9)$ | Re3-Te2 | 2.6790 (16) |
| $\mathrm{Re} 1-\mathrm{Re} 1^{i}$ | 2.6948 (13) | Re3-Te4 | $2.6892(15)$ |
| $\mathrm{Re} 1-\mathrm{Re} 3^{i}$ | $2.6958(10)$ | Re3-Te8 | $2.7307(13)$ |
| $\mathrm{Re} 1-\mathrm{Te} 2$ | 2.7057(13) | $\mathrm{Te} 5-\mathrm{Te} 7^{7 i}$ | 2.7749 (17) |
| $\mathrm{Re} 1-\mathrm{Te} 1$ | 2.7085(13) | Te5-Te5 ${ }^{\text {iii }}$ | 2.928 (2) |
| Re1-Te5 | 2.7086(13) | Te6-Te7 | $2.7703(17)$ |
| $\mathrm{Re} 1-\mathrm{Te} 2{ }^{i}$ | 2.7166 (13) | Te6-Te6 ${ }^{\text {iii }}$ | 2.930(2) |
| $\mathrm{Re} 2-\mathrm{Te} 3$ | 2.6844(13) | Te8-Br2 | 2.574(2) |
| Re2-Re3 | 2.6919 (10) | Te8-Br3 | 2.585(2) |
| $\mathrm{Re} 2-\mathrm{Re} 3^{i}$ | 2.6960 (10) | Te8-Br1 | 2.969(2) |
| $\mathrm{Re} 2-\mathrm{Te} 1$ | 2.7046 (13) |  |  |
| Re2-Te4 | 2.7047(13) | Angle | $\left({ }^{\circ}\right)$ |
| $\mathrm{Re} 2-\mathrm{Te} 4^{i}$ | 2.7072(14) | $\mathrm{Te} 7^{i i}-\mathrm{Te} 5-\mathrm{Te} 5^{\text {iii }}$ | 93.21(5) |
| $\mathrm{Re} 2-\mathrm{Re} 2^{i}$ | 2.7077(14) | Te7-Te6-Te6 ${ }^{\text {iii }}$ | 93.31(5) |
| Re2-Te6 | 2.7199(13) | Te6-Te7-Te5 ${ }^{\text {iv }}$ | 106.37(5) |

Symmetry codes: (i) $-\mathrm{x},-\mathrm{y}, \mathrm{z}$; (ii) $\mathrm{x}, \mathrm{y}, 1+\mathrm{z}$; (iii) $-\mathrm{x}, 1-\mathrm{y}, \mathrm{z}$; (iv) $\mathrm{x}, \mathrm{y}, \mathrm{z}-1$.
ratio $1: 2: 5$. An excess of Te and $\mathrm{Br}_{2}$ were taken to promote the growth of single crystals of title compound. The synthesis was carried in an evacuated fused-silica tube heated at 723 K for 48 hours and then cooled 12 hours to room temperature. The reaction mixture was washed with $\mathrm{CH}_{3} \mathrm{CN}$. Single crystals suitable for X-ray analysis were selected from reaction mixture.
X-ray Crystallography: Single-crystal X-ray diffraction data were collected on $\mathrm{Re}_{6} \mathrm{Te}_{16} \mathrm{Br}_{6}$ using graphite-monochromotized $\mathrm{MoK}_{\alpha}$ radiation $(\lambda=0.71073 \AA$ ) with a Bruker Smart APEX CCD diffractometer with the operating program SMART. A face-indexed absorption correction was performed numerically with the use of XPREP. The program SADABS was then employed to make incident beam and
decay corrections: $\mathrm{T}_{\min }=0.1697, \mathrm{~T}_{\max }=0.4916$. The structure was solved by direct method with the SHELX-97 program set ${ }^{10}$ for structure solution (direct methods) and refinement (full-matrix least-squares on $F^{2}$ ).
$\mathbf{R e}_{6} \mathbf{T e}_{16} \mathbf{B r}_{6}:(\mathrm{M}=3638.26)$, crystal size $0.1 \times 0.024 \times$ 0.018 mm , orthorhombic space group $P 2_{1} 2_{1} 2, a=18.466(4)$, $b=8.5102(18), c=10.784(2) \AA, V=1694.8(6) \AA^{3}, Z=2$, $\rho_{\text {calcd }}=7.130 \mathrm{~g} \mathrm{~cm}^{-3}, \mu=41.912 \mathrm{~mm}^{-1} .2 .19<\theta<28,29^{\circ}, T$ $=295(2) K$. Reflections: 10528 collected, 3964 unique $\left(R_{\text {int }}\right.$ $=0.0432$ ), 3093 observed $[I>2 \sigma(I)] ; 127$ parameters refined with $R=0.0343[I>2 \sigma(I)], w R_{2}=0.0709$ (all data). GOF $=0.940$, residual electron density: $+4.328,-1.680 \mathrm{e}^{\AA^{-3}}$. Flack parameter $=0.008(10)$.
