Accepted February 6, 2009

#### Abstract

We developed an efficient three-step synthetic protocol of $\gamma$-hydroxybutenolides starting from the Baylis-Hillman adducts: (i) bromination, (ii) Barbier reaction and (iii) one-pot $\mathrm{K}_{2} \mathrm{CO}_{3}$-mediated synthesis of $\gamma$-hydroxy butenolides. In addition, we showed the synthetic applicability of butenolides including self-dimerization, conjugate addition reaction, and alkylations.

Key Words: Baylis-Hillman adducts. $\gamma$-Hydroxybutenolides. Hydroxy lation, Lactones

## Introduction

5-Hydroxyfuran-2( 5 H )-ones ( $\gamma$-lydroxybutenolides) are an important class of compounds because they often occur in natural products and exhibit a broad range of biological activities. ${ }^{1-3}$ These compounds are considered as antimutagen. bactericides. antitumor agents. allergy inhibitors, phospholipase A2 inhibitors, etc. ${ }^{1}$ Relevant examples include dysidiolide. manoalide. petrosaspongiolides and cacospongionolides (Figure 1). ${ }^{1} \gamma$-Hydroxybutenolides are also useful as synthetic intermediates in the preparation of physiologically active compounds. Because of the importance in chemical as well as pharmaceutical research much attention has been focused on the efficient and diverse synthesis of this class of compounds. ${ }^{1-3}$

The most prevalent way to $\gamma$-hydroxybutenolide is the photooxidation of the furan moiety under basic conditions. ${ }^{\text {laee. } 3}$ $\gamma$-Hydrosybutenolides can also be synthesized from the corresponding butenolides by the aerobic oxidation of butenolidecontaining sugar ${ }^{\text {e }}$ or 4-halobutenolides. ${ }^{\text {ª }}$

## Results and Discussion

Based on the reported results, ${ }^{\text {Ta }}$.

Dysidiolide ( $\mathrm{C}_{\mathrm{dc}} 25 \mathrm{~A}$ inhibitor)

Petrosaspongiolide M ( $h s P \leq A_{2}$ inhibitor)

(hsPLA 2 inhibitor)

Cacospongionolide E (nsPLA $A_{2}$ inthibitor)

Figure 1. Natural $\gamma$-hydroxybutenolides.
methy lene- $\gamma$-butyrolactone such as 4 a can be transformed into $\gamma$-hydroxybutenolide 7 a via the sequential migration of double bond and concomitant aerobic oxidation process (Scheme 1). $\alpha$-Methylene- $\gamma$-butyrolactones ${ }^{4}$ can be synthesized by lactonization ( $p-\mathrm{TsOH}$ ) of the corresponding $\alpha$ -methylene- $\gamma$-hydroxyester 3a which can be prepared from the Baylis-Hillman adduct ${ }^{1+6}$ wia the two-step bromination and indium-mediated Barbier reaction protocol. ${ }^{4}$

Cinuamyl bromide 1a was prepared by the reaction of Bay lis-Hillman adduct and HBr as reported ( $95 \%$ ). ${ }^{+5}$ Indiummediated Barbier type reaction of $\mathbf{1 a}$ and benzaldehyde (2a) produced $s w n-\mathbf{3 a}$ as the sole compound as reported in $98 \%$. ${ }^{4}$ Treatment of 3a with $p$-toluenesulfonic acid ( $10 \mathrm{~mol} \%$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ furnished $\alpha$-methylene- $\gamma$-buty rolactone ta in $95 \%$. ${ }^{4}$ Double bond migration was carried out under the influence of $\mathrm{Pd} / \mathrm{C}$ under hydrogen balloon atmosphere in ethanol to produce butenolide 5ain 71\%. Fully-reduced compound was not observed in this case (vide infra). As expected 5 a was converted into its 5 -hydroxy derivative 7 a by aerobic oxidation process under the conditions of $\mathrm{K}_{2} \mathrm{CO}_{3}(30 \mathrm{~mol} \%)$ in DMF in good yield ( $94 \%$ ). ${ }^{\text {2a.a.e. }}$ Initially we exposed the reaction misture under air stream. however the reaction showed almost same reactivity without bubbling of air. In some cases. especially under the influence of DBU instead of $\mathrm{K}_{2} \mathrm{CO}_{2}$. we observed the formation of a trace amount of hydroperoxide $6 \mathrm{a}^{9}$ which was changed to 7 a by treatment with $\mathrm{PPh}_{3}$ quantitatively (vide infra).

The reaction of ta under the same conditions (DMF, $\mathrm{K}_{2} \mathrm{CO}_{3} .90^{\circ} \mathrm{C}$ ) also produced 7 a in $67 \%$ y ield. presumably via the simultaneous double bond isomerization and aerobic oxidation. More preferably, the reaction of $\alpha$-methylene- $\gamma-$ hydroxyester 3a under the same conditions (DMF. $\mathrm{K}_{2} \mathrm{CO}_{3} .90$ ${ }^{\circ} \mathrm{C}$ ) gave 7 a in good yield ( $69 \%$ ) also. Overall yields of compound 7a were all similar: overall $63 \%$ yield for the three-step process (from $\mathbf{3 a}$ via 4 a and $\mathbf{5 a}$ ): $64 \%$ for the two-step sequence (from 3avia $\mathbf{4}$ ): $69 \%$ for direct synthesis from 3a Based on the simplicity and the yield of product 7adirect synthesis from 3 a was found as the best process. However. we observed some unknown compounds during the

$\mathrm{OBU}\left(0.3\right.$ equiv), $\mathrm{CH}_{3} \mathrm{CN}$, it. $5 \mathrm{~h}: 6 \mathrm{a}(1 \%), 7 \mathrm{a}(5 \%), 8 \mathrm{a}(62 \%)$, $9 \mathrm{a}(12 \%)$
$\mathrm{DBU}\left(1.2\right.$ equiv), $\mathrm{CH}_{3} \mathrm{CN}, \mathrm{rt}, 1 \mathrm{~h}: \mathbf{6 a}(14 \%)$, $7 \mathrm{a}(13 \%)$, $8 \mathbf{a}(43 \%)$, $9 \mathrm{a}(8 \%)$
Scheme 1. Optimization of conditions for the conversion of 3a to 7a.
synthesis of 7 a from 3a or 4 a . In order to identify the side products we examined the reactions carefully. When we run the reaction of ta in the presence of DBU ( $30 \mathrm{~mol} \%$ ) in $\mathrm{CH}_{3} \mathrm{CN}$ at room temperature. we observed the formation of compounds $6 \mathbf{a}(1 \%) .7 \mathbf{a}(5 \%)$ and diastereomeric dimers. $8 \mathbf{a}(62 \%)$ and $9 \mathbf{a}$ ( $12 \%$ ). ${ }^{16}$ With excess amounts of $\operatorname{DBU}(1.2$ equiv) the ratio was changed to increase the amounts of $6 \mathbf{a}(14 \%)$ and $7 a$ ( $13 \%$ ). Hydroperoxide 6 a might be the plausible intermediate for the formation of 7a as mentioned above. Dimeric compounds $8 \mathbf{a}$ and $9 \mathbf{a}$ were produced ( $51-74 \%$ ) by conjugate addition of the anion of ta to the exo-methylene moiety of ta The ratio of major and minor was $84: 16$ in both cases. The structures of compound 7a and 8a were assigned unequivocally by their X-ray crỵstal stnictures (Figures 2 and 3). ${ }^{11,12}$

Encouraged by the results. we prepared some analogous $\alpha$ -methylene- $\gamma$-hydroxyesters $\mathbf{3 b - i}$ by following the same procedure of 3a and examined the one-pot synthesis of $\gamma$ hydroxybutenolides and the results are summarized in Table 1. We selected three Baylis-Hillman adducts which were derived from benzaldehyde $\left(\mathrm{R}_{\mathrm{l}}=\mathrm{Ph}\right)$, 4 -chlorobenzaldehyde ( $\mathrm{R}_{1}=4-\mathrm{ClC}_{6} \mathrm{H}_{4}$ ) and hexanal ( $\mathrm{R}_{1}=\mathrm{C}_{5} \mathrm{H}_{11}$ ). In the next Barbier reaction we examined six aldehydes namely benzaldehyde $\left(\mathrm{R}_{2}=\mathrm{Ph}\right)$. 2-bromobenzaldehyde $\left(\mathrm{R}_{2}=2-\mathrm{BrC}_{6} \mathrm{H}_{4}\right)$. 4-chlorobenzaldehyde ( $\mathrm{R}_{2}=4-\mathrm{ClC}_{6} \mathrm{H}_{4}$ ). 4-methoxybenzaldehyde ( $\mathrm{R}_{2}$ $\left.=4-\mathrm{MeOC}_{6} \mathrm{H}_{4}\right)$, 2 -naphthylaldelyde $\left(\mathrm{R}_{2}=2\right.$-naphthyl) and hexanal $\left(\mathrm{R}_{2}=\mathrm{C}_{5} \mathrm{H}_{11}\right)$. In all cases except entries 8 and $9 . \gamma$ hydroxybutenolides 7a-g were prepared successfully in $53-69 \%$ yields. Aryl substituents $R_{1}$ and $R_{2}$ might facilitate both double-bond isomerization and aerobic oxidation process. When $R_{1}$ or $R_{2}$ is pentyl (entries 8 and 9). $\alpha-$ methylene $-\gamma$ butyrolactones $\mathbf{4 h}$ and $\mathbf{+ i}$ were isolated in ligh yields ( $94-95 \%$ ) instead of desired $\gamma$-hydroxybutenolides 7 h and $7 \mathbf{i}$.

Figure 2. ORTEP drawing of compound 7a.

Figure 3. ORTEP drawing of compound 8a.

Table 1. Synthesis of $\gamma$-hydroxybutenolides

${ }^{\circ}$ Compounds $\mathbf{t h}$ and $\mathbf{t i}$ were isolated in high yields instead of 7 h and $7 \mathbf{i}$.
${ }^{\mathrm{t}}$ Compounds $\mathbf{7 h}$ and $7 \mathbf{i}$ were synthesized from th and $\mathbf{4 i}$ (Scheme 2).

When we subjected the reaction mixture of $\mathbf{3 h}$ for a long time ( 15 h ). as an example, we could isolate 7 h in low yield ( $22 \%$ ) , together with dimeric compounds $\mathbf{8 h}(28 \%)$ and 9 h ( $7 \%$ ). The reactivity of $\mathbf{3 i}$ was similar and we obtained $7 \mathbf{i}$ $(25 \%) .8 \mathbf{i}(28 \%)$ and $9 \mathbf{i}(2 \%)$ under the same conditions (Scheme 2). Thus, we applied three-step conditions (vide supra) to 3 h and 3i as in Scheme 2, namely lactonization. isomerization and aerobic oxidation. During double-bond isomerization process of $\mathbf{4}$ h and $\mathbf{4 i}$, fully reduced side products were formed a little and contaminated in about 20\% (based on ${ }^{1} \mathrm{H}$ NMR) thus make the separation of pure $\mathbf{5 h}$ and $\mathbf{5 i}$ very difficult. Thus we carried out the isomerization under small size $\mathrm{H}_{2}$ balloon and stopped the reaction after 5 h (starting material was remained in appreciable amounts). By using this protocol pure $\mathbf{5 h}$ and $\mathbf{5 i}$ were obtained in 60 and $75 \%$, respectively. The next hydroxylation was carried out with DBU in $\mathrm{CH}_{3} \mathrm{CN}$. Compound 7 i was obtained at room temperature in high yield $(93 \%)$, while the oxidation of compound 5 h to 7 h required elevated temperature $\left(50^{\circ} \mathrm{C}\right)$ and long reaction time ( $2+\mathrm{h}$ ). By using the three-step protocol.

$3 i(s y n, 84 \%)$

$90^{\circ} \mathrm{C}, 15 \mathrm{~h}$ aerobic condilions

Scheme 2. Synthesis of 7 h and $7 \mathbf{i}$ from 3 h and 3 i vio three-step method.
compounds 7 h and $7 \mathbf{i}$ were synthesized elegantly from $\mathbf{3 h}$ and 3 i in $49-65 \%$ overall yields.

As we observed in the case of fa (vide supra. Scheme 1), the formation of dimeric compounds $8 \mathbf{a}$ and $9 \mathbf{a}$ can be regarded as the results of competition between air oxidation to $7 \mathbf{a}$ and conjugate addition reaction to $8 \mathbf{a}$ and $9 \mathbf{a}^{10,13}$ Air oxidation was the principal pathway with $\mathrm{K}_{2} \mathrm{CO}_{2}$ at elevated temperature ( $90^{\circ} \mathrm{C}$ ) while conjugate addition was the major reaction with DBU at room temperature. Thus. for the next examination, we tried conjugate additions of 5 a with some extemal Michael acceptors. methyl acrylate (10a), acrylonitrile (10b). phenyl vinyl sulfone (10c) and 2-cyclohexen-1-one ( $\mathbf{1 0 d}$ ). and the results are summarized in Table 2. As a comparison experiment, the reaction of $5 a$ and $10 a$ was carried out under aerobic conditions (entry 1), and we observed the formation of 7a and 11a. In order to reduce the formation of aerobic oxidation product 7 a the next reactions were carried out under the strictly controlled nitrogen atmosphere (entries 2-5). The corresponding conjugate addition products 11a-d were obtained in good to excellent yields ( $66-96 \%$ ) and

[^0]Table 3. Alkylation of butenolide 5 a

${ }^{2}$ No reaction under DBU conditions. ${ }^{b}{ }_{f}$ values of 13 c and 15 c were very similar and the vields of 13 c 15 c were calculated based on ${ }^{1} \mathrm{H}$ NMR spectrum of the mixture.
we did not observe the formation of 7 a nor the dimeric compounds 8 a and 9 a in these cases.

Alkylation reaction of 5 a with allyl bromide (12a), benzyl bromide ( $\mathbf{1 2 b}$ ) and iodomethane ( $\mathbf{1 2 c}$ ) was also examined. ${ }^{1+}$ Due to the possible resonance structures of the anion of 5 a . alkylation occurred at either $\alpha$ - and $\gamma$-positions (Table 3). ${ }^{15}$ The reaction of 5 a and allyl bromide under DBU conditions (entry 1) produced $\gamma$-adduct 13a ( $14 \%$ ) and $\alpha$-adduct 14a $(67 \%)$. The trend was same in the reaction of benzyl bromide (entry 2 ). and $\alpha$-adduct $\mathbf{1 + b}(70 \%)$ was the major product. The reaction of 5 a and iodomethane with DBU failed completely presumably due to the salt formation between $\mathrm{CH}_{3} \mathrm{I}$ and DBU ${ }^{16}$ Thus we carried out the reaction under the influence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ and obtained $13 \mathrm{c}(5 \%), 14 \mathrm{c}(52 \%)$ and $15 \mathrm{c}(25 \%)$ as in entry 3 (vide infra). In all cases $\alpha$-adduct was the major product irrespective of the kinds of alkyl halide and base. When we run the reaction with $\mathrm{K}_{2} \mathrm{CO}_{3}$ (entry 3) complete removal of molecular oxygen was very difficult due to the presence of volatile $\mathrm{CH}_{3} \mathrm{I}$. Thus appreciable amounts of $\gamma$ hydroxybutenolide 7a was formed and reacted with $\mathrm{CH}_{3} \mathrm{I}$ to produce finally $\gamma$-ketoester $\mathbf{1 5} \mathrm{c}$. Authentic compound $\mathbf{1 5} \mathrm{c}$ was prepared from the reaction of $7 a$ and $\mathrm{CH}_{3} \mathrm{I}$ ( 3.0 equiv) in the presence of $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( 1.2 equiv) in DMF ( ft .2 h ) in $93 \%$ yield.

In summary. we developed an efficient three-step synthetic protocol of $\gamma$-hydroxybutenolides starting from the BaylisHillman adducts: (i) bromination, (ii) Barbier reaction and (iii) one-pot $\mathrm{K}_{2} \mathrm{CO}_{3}$-mediated synthesis of $\gamma$-hydroxybutenolides. In addition. we showed the synthetic applicability of butenolides including the self-dimerization conjugate addition reaction. and alkylations.

## Experimental

General procedure. ${ }^{1} \mathrm{H}$ NMR ( 300 MHz ) and ${ }^{19} \mathrm{C}$ NMR ( 75 MHz ) spectra were recorded in $\mathrm{CDCl}_{3}$. The signal positions are reported in parts per million relative to TMS (o scale) used as an internal standard. $\mathbb{R}$ spectra are reported in $\mathrm{cm}^{-1}$. Mass spectra were obtained from the Korea Basic Science Institute (Gwangju branch). Melting points are uncorrected. The elemental analyses were carried out at Korea Research Institute of Chemical Technology. Daejeon. Korea. All reagents were purchased from commercial sources and used without further treatment. The separations were carried out by flash column chromatography over silica gel (230-400 mesh ASTM).

Organic extracts were dried over anhydrous $\mathrm{MgSO}_{4}$ and the solvents were evaporated on a rotary evaporator under water aspirator pressure.

Typical procedure for the synthesis of $3 a^{+2}$ To a stirred solution of $\mathbf{1 a}(765 \mathrm{mg}, 3.0 \mathrm{mmol})$ and benzaldehyde ( $\mathbf{2 a} .477$ mg. 4.5 mmol ) in aqueous THF ( $1: 1.5 \mathrm{~mL}$ ) was added indium powder ( $41+\mathrm{mg} .3 .6 \mathrm{mmol}$ ) and stirred at room temperature for 1 h . After extractive workup and column chromatographic purification process (hexanes/EtOAc, 8:1) sv-3a was isolated as colorless oil. 829 mg ( $98 \%$ ). Other compounds $\mathbf{3 b}$-i were prepared similarly and the spectroscopic data of 3a-i are as follows.

Compound $\mathbf{3 a}{ }^{\text {te }}$ : Yield $98 \%$ : colorless oil: $\mathbb{R}$ (film) 3503. 1717. 1249, $1144 \mathrm{~cm}^{-1}$ : ${ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right) ~ \hat{\delta} 2.30(\mathrm{~d}$, $J=3.6 \mathrm{~Hz}, \mathrm{IH}) .3 .45(\mathrm{~s} .3 \mathrm{H}) .4 .26(\mathrm{dd}, J=8.1$ and $0.9 \mathrm{~Hz}, \mathrm{IH})$, $5.18(\mathrm{dd}, J=8.1$ and 3.6 Hz .1 H$) .5 .74(\mathrm{~d}, J=0.9 \mathrm{~Hz} .1 \mathrm{H}) .6 .18$ (d. $J=0.9 \mathrm{~Hz} .1 \mathrm{H}) .7 .16-7.30(\mathrm{~m} .10 \mathrm{H}):{ }^{13} \mathrm{C} \mathrm{NMR}\left(\mathrm{CDCl}_{3} .75\right.$ $\mathrm{MHz}) ~$ oे 51.63. 54.03. 75.41, 126.69, 126.80, 126.90. 127.48. 127.96. 128.23. 129.06, 138.56. 140.93, 142.03, 166.78; ESIMS mz $283\left(\mathrm{M}^{-}+1\right)$.
