

Vascular Plant Diversity of Jeju Island, Korea

Kim Chan-Soo*

Warm-Temperate Forest Research Center, Korea Forest Research Institute, Seogwipo 697-050, Korea

Abstract - The vascular plants in Jeju composed of 21 families 62 genera, 190 species, 7 varieties with 197 taxa in Pteridophyta, 3 families 5 genera, 7 species, 3 forma with 10 taxa in gymnosperm (Coniferophyta) and 143 families 703 genera, 1,622 species, 114 varieties and 47 forma with 1,783 taxa in Endospermae. The total number of taxa was 1,990 consisting 167 families, 770 genera, 1,818 species, 121 varieties and 50 forma. Three families, 4 genera 4 species and 1 variety in Pteridophyta and 1 family, 1 genus 1 species, 1 forma of Coniferophyta were endemic to Jeju. Five families, 8 genera and 8 species in the Monocotyledonae of Endospermae and 23 families, 32 genera, 21 species, 16 varieties and 7 forma and 44 taxa in Cholipetalae, and 9 families, 24 genera, 12 species, 13 varieties and 7 forma, total 32 taxa in Sympetalae were endemic to Jeju. Total 90 taxa with 41 families, 69 genera, 46 species, 29 varieties and 15 forma were drawn up as endemic plants in Jeju. As the numbers show on, Jeju has more biodiversity especially plant diversity than any other places in Korea. It was an important region in regard to geographical position. The rarity on plants from Jeju has been assessed based on the IUCN red list categories and criteria at both regional and global levels. There was one species in each extinct (EX) and extinct in the Wild (EW). The EX and EW species were *Rhododendron salsiuense* Nakai (Ericaceae) and *Asplenium antiquum* Makino (Aspleniaceae), respectively. Three taxa, *Rhododendron dauricum* L. (Ericaceae), *Lycopodium sieboldii* Miq., and *Lycopodiella cernua* (L.) Serm (Lycopodiaceae) were species that is extinct in the region (RE). Sixty-one taxa were critically endangered (CR), 13 were endangered (EN), and 83 were vulnerable (VU) at regional level. The taxa listed on a Red List corresponds 26.9% of total taxa in Jeju. At global level, there were 19 taxa in CR, 4 in EN, and 1 in VU (Vulnerable) as the category of threat. The rest taxa (133 taxa) were classified as Least Concern (LC). According to the results of the assessment, conservation measures must be taken for total of 157 species that were categorized in threaten including one of EX, one of EW and three extinct in the region immediately. Of 157 species, 61 were CR, 13 are EN and 83 were VU.

Key words - vascular plants, Jeju, endemic plants, rare plants, IUCN, red list

Introduction

Jeju is a volcanic island that covers an area of 1,848 km² and lies in southwestern sea of Korean peninsula and the north of East China Sea (Fig. 1). Hallasan Mountain, 1,950 m high, dominated in center of the island. It has been a most interesting research site for plants because of its richness and unique biogeographic feature. The Island is classified as belonging to the East Asiatic floristic region of the Holarctic floristic kingdom. Furthermore, given its unique geographical and geological location, it is also classified as the East Siberian floristic region, in addition to serving as a boundary that begins to exhibit features of the Indo-Malaysian sub-kingdom.

Consequently, the flora of Jeju was derived from greatly divergent floristic kingdoms. Some traveled southward from

the main continent; others survived on a long and narrow journey from China, Jeju and Japan; some were originated from tropical and subtropical zones; some were evolved from the flora of Jeju, Taiwan and Japan. As such, distributed on a relatively small area, the flora of Jeju exhibits astoundingly diverse traits and characteristics.

In this report, the status of vascular plants distributed in Jeju, Korea was summarized. To obtain the list, specimens, photos or descriptions were examined in 18 herbariums, Warm-Temperate Forest Research Center of Korea Forest Research Institute (WTFRC), Kangwon National Univ. (KWNA), Kyeongbuk National Univ. (KBNA), Gyeongsang National Univ. (GSNA), Korea Univ. (KUSA), Korea National Arboretum (KNKA), Taejeon Univ. (TUT), Pusan National Univ. (PSNA), Seoul National Univ. For. Coll. (SNFA), Seoul National Univ. (SNBA), Seonkyungwan Univ. (SKKA), Sooncheon National Univ. (SCNA), Natural Museum of Ewha Univ. (ENHA), Ewha Univ. (EWUA),

Cheonbuk National Univ. (CBBA), Cheju National Univ. (CJUA), Chungbuk Natioanl Univ. (CBUA), and Hongneung Arboretum (KNHA), and published literatures (Lee, 1996; Koh, 1999; Kim, 2005, 2006a, 2006b, 2006c; Kim *et al.* 2006a, 2006b).

Flora of Jeju Island

The vascular plants in Jeju were found that 21 families 62 genera, 190 species, 7 varieties with 197 taxa in Pteridophyta, 3 families 5 genera, 7 species, 3 forma with 10 taxa in gymnosperm (Coniferophyta) and 143 families 703 genera, 1,622 species, 114 varieties and 47 forma with 1,783 taxa in Endospermae exist. The total number of taxa was 1,990 representing 167 families, 770 genera, 1,818 species, 121 varieties and 50 forma (Table 1). It included endemic plants in Jeju, 22 families 69 genera, 87 species, 3 varieties and 3 cultivars with 197 taxa, and naturalized plants, 45 families 154 genera, 246 species, 5 varieties with 251 taxa (Park *et al.*,

2002; Kim *et al.*, 2007).

In Pteridophyta, 197 taxa with 21 families, 62 genera, 190 species and 7 varieties including Psilotaceae were distributed in Jeju (Table 2). The most dominant family was Aspleniaceae which consists of 14 genera, 87 species and 3 varieties with 90 taxa followed by Pteridaceae, 12 genera, 21 species 2 varieties of 23 taxa and Polypodiaceae, 9 genera 21 species, and Aspleniaceae, 2 genera 17 species 1 variety, and Lycopodiaceae, 1 genus 8 species. There were seven families with 1 genus and 1 species. They were Psilotaceae, Osmundaceae, Schizaeaceae, Blechnaceae, Vittariaceae, Marsileaceae, and Salviniaceae.

Three families, 5 genera, 7 species and 3 forma of gymnosperm (Coniferophyta) were found in Jeju (Table 3). *Taxus cuspidata* in Taxaceae, 2 genera and 2 species of *Torreya* including *Torreya nucifera*, *Pinus densiflora*, *Pinus thunbergii*, and *Abies koreana* in Pinaceae, and 1 genus and 2 species in

Cupressaceae were major Coniferophyta in Hallasan. Coniferophyta in Jeju were *Taxus cuspidata*, *Torreya nucifera*, *Pinus densiflora*, *Pinus thunbergii*, *Abies koreana*, *Juniperus chinensis*. var. *sargentii* and *Juniperus rigida*, and 3 subspecies in *Abies koreana*.

Monocotyledonae, which belongs to Endospermae, contained 492 taxa with 25 families, 197 genera, 455 species, 24 varieties and 13 cultivars including Typhaceae (Table 4).

Gramineae was most dominant family that consists 83 genera, 134 species, 15 varieties and 7 as with 156 taxa, which followed by Cyperaceae, 10 genera, 98 species, 4 varieties with 102 taxa, Orchidaceae, 36 genera, 66 species, 3 varieties and 1 forma with 70 taxa, Liliaceae, 22 genera, 57 species, 2 varieties and 4 forma with 63 taxa, Juncaceae, 2 genera and 15 species, Potamogetonaceae, 3 genera and 11 species, and Araceae, 3 genera, 10 species and 1 variety.

The families which consist of 1 family, 1 genus and 1 species were Typhaceae, Scheuchzeriaceae, Musaceae and Cannaceae. Just two families are native to Jeju because Cannaceae is a naturalized exotic family.

Dicotyledoneae was divided two groups, Cholipetalae and Sympetalae because many taxa were included in this. Cholipetalae contained 83 families, 301 genera, 712 species 44 varieties and 19 forma with 775 taxa representing Saururaceae (Table 5).

Geraniaceae	2	12	1	1		83	301	712	44
									19

The most dominant family was Rosaceae which consists of 19 genera, 62 species, and 11 varieties with 75 taxa. The next was Leguminosae, 29 genera, 67 species, 4 varieties 2 forma with 73 taxa, followed by Umspeciesiferae, 28 genera 43 species 3 varieties and 1 forma with 47 taxa, Ranunculaceae, 15 genera 42 species 1 forma with 43 taxa, Polygonaceae, 7 genera, 40 species and 2 varieties with 42 taxa, Cruciferae, 18 genera 34 species and 2 varieties with 36 taxa, Caryophyllaceae, 10 genera, 28 species and 2 varieties with 30 taxa, and Violaceae, 1 genera, 20 species, 2 varieties and 1 forma with 23 taxa.

Twenty two families, Piperaceae, Myricaceae, Juglandaceae, Cannabinaceae, Nictaginaceae, Portulacaceae, Ceratophyllaceae, Berberidaceae, Illiciaceae, Pittosporaceae, Linaceae, Zygophyllaceae, Simaroubaceae, Meliaceae, Polygalaceae, Buxaceae, Empetraceae, Sapindaceae, Elaeocarpaceae, Sterculiaceae, Opuntiaceae, Alangiaceae had only 1 genus and 1 species. Among these, Nictaginaceae, Phytolaccaceae and Sterculiaceae are naturalized exotic species; therefore only 19 families were native to Jeju.

Sympetalae in Dicotyledoae consists of 35 families, 205

genera, 454 species, 46 varieties and 15 forma with 515 taxa including Diapensiaceae (Table 6).

Compositae was most dominant family as of 184 taxa with 67 genera, 166 species, 13 varieties, 5 forma. Laviatae followed as consisting of 22 genera, 43 species, 11 varieties, 3 forma with total of 57 taxa. Scrophulariaceae, 16 genera, 27 species, 5 varieties with 32 taxa, Rubiaceae, 9 genera, 25 species, 3 varieties and 1 forma with 29 taxa, Solanaceae, 8 genera, 19 species and 1 variety with 20 taxa, Caprifoliaceae, 4 genera, 19 species and 2 varieties with 21 taxa, and Convolvulaceae, 5 genera, 14 species, 1 variety with 15 taxa. The families with 1 genus and 1 species were Diapensiaceae, Cletheraceae, Plumbaginaceae, Bignoniaceae, Phrymaceae, Adoxaceae, Dipsacaceae. Six of these families are native to Jeju and Bignoniaceae is a naturalized exotic family.

Endemic to Jeju Island

Three families, 4 genera 4 species and 1 variety in Pteridophyta and 1 family, 1 genus 1 species, 1 forma of Coniferophyta were endemic to Jeju. Five families, 8 genera and 8

86	<i>Kalimeris chejuensis</i> Kim & Chung (Compositae)
87	<i>Leontopodium hallasanense</i> Hand.-Mazz. (Compositae)
88	<i>Saussurea maximowizii</i> var. <i>triceps</i> (Lev. & Vaniot) Kitamura (Compositae)
89	<i>Serratula cornuta</i> L. var. <i>alpina</i> Nakai (Compositae)
90	<i>Taraxacum hallasanensis</i> Nakai (Compositae)

species in the Monocotyledonae of Endospermae and 23 families, 32 genera, 21 species, 16 varieties and 7 forma, total 44 taxa in Cholipetalae, and 9 families, 24 genera, 12 species, 13 varieties and 7 forma, total 32 taxa in Sympetalae were endemic to Jeju. Total 90 taxa with 41 families, 69 genera, 46 species, 29 varieties and 15 forma were drawn up as endemic plants in Jeju (Table 7).

The families having large numbers of endemic plants were Compositae (14 taxa), Rosaceae (11 taxa), Scrophulariaceae (6 taxa), Laviatae (5 taxa) and 3 species of Orchidaceae, Urticaceae, Leguminosae and Umbelliferae respectively. Sorting by genus, *Prunus* (6 taxa), *Aster* (6 taxa), *Rubus* (4 taxa) and *Boehmeria* (3 taxa) were in order. Endemic plants were diverse on the families and genera. Although the numbers or size of populations was small, only few of endemic plants were listed on Red Data Book (IUCN, 2006). In order to protect the endemic plant resources from the global warming and civilizations by humans, conservation efforts were required (Kim, 2002; Kong, 1998).

Rare plants

The rarity on plants from Jeju has been assessed based on the IUCN red list categories and criteria at both regional and global levels (IUCN, 2003, 2006; Kim *et al.*, 2007). The objective data from the assessment will be useful for establishing policy on endangered flora and conducting environment impact assessment.

As results, at regional level, there was one taxon in Extinct (EX), one in Extinct in the Wild (EW), 3 in Extinct in the Region (RE), 61 in Critically Endangered (CR), 13 in Endangered (EN), 83 in Vulnerable (VU), and 374 in Near Endangered (NE). The rest taxa fall in Least Concern (LC) and in Data Deficient (DD) (Table 8).

The taxa listed on a Red List corresponds 26.9% of total taxa (1,990) in Jeju. It was higher than that of Japan, which was 24%.

With the evaluations at the level of region, there were total of 536 taxa as the Red Lists that represent 1 of Extinct, 1 of Extinct in the Wild, 3 of Extinct in the Region, 61 of Critically Endangered, 13 of Endangered, 83 of Vulnerable, and 374 of Near Threatened. The taxa, which were required immediate conservation actions by the authorities in Jeju, were total of 157 that were classified as the categories of Critically Endangered (61), Endangered (13), and Vulnerable (83).

Followed species were classified as the category of Critically Endangered at global level; *Isoetes sinensis* Palmer, *Mankyua chejuense* B. Y. Sun, M. H. Kim & C. H. Kim, *Silene fasciculata* Nakai, *Prunus hallasanensis* Chan S. Kim & M. Kim, *Prunus longistylus* Chan S. Kim & M. Kim, *Prunus yedoensis* Matsumura var. *yedoensis*, *Prunus yedoensis* var. *angustipetala* Chan S. Kim & M. Kim, *Orobanche filicicola* Nakai, *Leontopodium hallasanense* Hand.-Mazz., *Oreorchis coreana* Finet. These ten species were also classified as the same category at global level. The endangered species was *Eleutherococcus divaricatus* var. *chiisanensis* (Nakai) C.H. Kim & B.Y.Sun.

Eight species of ten in endangered at regional level were classified as critically endangered species at global level. These were *Salix blinii* Lev., *Arabis serrata* var. *hallasanensis* (Nakai) Ohwi, *Astragalus nakaianus* Y.N.Lee, *Rhamnus taquetii* (Lev.) Lev., *Pedicularis hallasanensis* Hurusawa, *Dendranthema coreanum* (H. Lev. & Vaniot) Vorosch. and *Lycoris chejuensis* K.Tae & S.Ko. Two of them were also classified as endangered at global level. These were *Asarum misandrum* B.Oh & J.Kim and *Megaleranthis saniculifolia* Ohwi.

One species in category of Vulnerable at regional level, *Euphrasia coreana* W. Becker was critically endangered at global level and the other, *Salix hallaisanensis* Lev., was endangered species at global level.

When 157 taxa evaluated as Red Lists at regional level

Table 8. Summary of number of species in each Red List category

Extinct (EX)	Extinct in the Wild (EW)	Extinct in the Region (RE)	Critically Endangered (CR)	Endangered (EN)	Vulnerable (VU)	Near Threatened (NT)	Least Concern (LC)	Data Deficient (DD)
1	1	3	61	13	83	374	907	526

were classified again at global level, 19 were critically endangered, 4 were endangered, 1 was vulnerable, and the rest were least concern (Table 9).

Conservation actions must be taken immediately for the species that were classified as critically endangered (61), endangered (13) and vulnerable (83) (Table 10).

Adopting the policy to protect wild fauna and flora will be appropriate to protect the species in the Red List. For example, the critically endangered and endangered species are regarded as the first class of endangered species, and the vulnerable species are regarded as the second class.

Table 9. Number of species in each Red List Category using standard of IUCN

Critically Endangered	Endangered	Vulnerable	Least Concern	Total
