ABSTRACT. In this paper, we introduce  $(\tilde{g}, s)$ -continuous functions between topological spaces, study some of its basic properties and discuss its relationships with other topological functions.

### 1. Introduction

It is well known that the concept of closedness is fundamental with respect to the investigation of general topological spaces. Levine [28] initiated the study of generalized closed sets. The concept of  $\tilde{g}$ -closed sets was introduced by Jafari et al [23]. Initiation of contra-continuity was due to Dontchev [10]. Many different forms of contra-continuous functions have been introduced over the years by various authors [5, 11, 14, 15, 17, 19, 20, 22, 39].

In this paper, new generalizations of contra-continuity by using  $\tilde{g}$ -closed sets called  $(\tilde{g}, s)$ -continuity are presented. Characterizations and properties of  $(\tilde{g}, s)$ -continuous functions are discussed in detail. Finally, we obtain many important results in topological spaces.

Key words and phrases:  $\tilde{g}$ -closed set, regular open set,  $\tilde{g}$ - $T_{1/2}$  space,  $(\tilde{g}, s)$ -continuous function.

## 2. Preliminaries

In this paper, spaces  $X$  and  $Y$  mean topological spaces on which no separation axioms are assumed unless explicitly stated. For a subset  $A$  of a space  $X$ ,  $\text{cl}(A)$  and  $\text{int}(A)$  represent the closure of  $A$  and the interior of  $A$  respectively.

A subset  $A$  of a space  $X$  is said to be regular open (resp. regular closed) if  $A = \text{int}(\text{cl}(A))$  (resp.  $A = \text{cl}(\text{int}(A))$ ) [46]. The  $\delta$ -interior [51] of a subset  $A$  of  $X$  is the union of all regular open sets of  $X$  contained in  $A$  and it is denoted by  $\delta\text{-int}(A)$ . A subset  $A$  is called  $\delta$ -open [51] if  $A = \delta\text{-int}(A)$ . The complement of  $\delta$ -open set is called  $\delta$ -closed. The  $\delta$ -closure of a set  $A$  in a space  $(X, \tau)$  is defined by  $\delta\text{-cl}(A) = \{x \in X: A \cap \text{int}(\text{cl}(U)) \neq \phi, U \in \tau \text{ and } x \in U\}$  and it is denoted by  $\delta\text{-cl}(A)$ .

The finite union of regular open set is said to be  $\pi$ -open [53]. The complement of  $\pi$ -open set is said to be  $\pi$ -closed. A subset  $A$  is said to be semi-open [27] (resp.  $\alpha$ -open [33], preopen [32],  $\beta$ -open [1] or semi-preopen [2]) if  $A \subset \text{cl}(\text{int}(A))$  (resp.  $A \subset \text{int}(\text{cl}(\text{int}(A)))$ ,  $A \subset \text{int}(\text{cl}(A))$ ,  $A \subset \text{cl}(\text{int}(\text{cl}(A)))$ ). The complement of semi-open (resp.  $\alpha$ -open, preopen,  $\beta$ -open) is said to be semi-closed (resp.  $\alpha$ -closed, preclosed,  $\beta$ -closed). The union (resp. intersection) of all  $\alpha$ -open (resp.  $\alpha$ -closed) sets, each contained in (resp. containing) a set  $S$  in a topological space  $X$  is called  $\alpha$ -interior (resp.  $\alpha$ -closure) of  $S$  and it is denoted by  $\alpha\text{int}(S)$  (resp.  $\alpha\text{cl}(S)$ ). The union (resp. intersection) of all semi-open (resp. semi-closed) sets, each contained in (resp. containing) a set  $S$  in a topological space  $X$  is called semi-interior (resp. semi-closure) of  $S$  and it is denoted by  $\text{sint}(S)$  (resp.  $\text{scl}(S)$ ). The union (resp. intersection) of all preopen (resp. preclosed) sets, each contained in (resp. containing) a set  $S$  in a topological space  $X$  is called preinterior (resp. preclosure) of  $S$  and it is denoted by  $\text{pint}(S)$  (resp.  $\text{pcl}(S)$ ).

A subset  $A$  of a space  $X$  is said to be generalized closed (briefly,  $g$ -closed) [28] (resp.  $\pi g$ -closed [13],  $\hat{g}$ -closed [48],  $*g$ -closed [49]) if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open (resp.  $\pi$ -open, semi-open,  $\hat{g}$ -open,  $*g$ -open) in  $X$ . The complement of  $g$ -closed (resp.  $\pi g$ -closed,  $\hat{g}$ -closed,  $*g$ -closed) is said to be  $g$ -open (resp.  $\pi g$ -open,  $\hat{g}$ -open,  $*g$ -open). A subset  $A$  of a space  $X$  is said to be  $\#gs$ -closed [50] if  $\text{scl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $*g$ -open in  $X$ . The complement of  $\#gs$ -closed is called  $\#gs$ -open. A subset  $A$  of a space  $X$  is said to be  $\tilde{g}$ -closed [23] if  $\text{cl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $\#gs$ -open in  $X$ . The complement of  $\tilde{g}$ -closed is said to be  $\tilde{g}$ -open. The union (resp. intersection) of all  $\tilde{g}$ -open (resp.  $\tilde{g}$ -closed) sets, each contained in (resp. containing) a set  $S$  in a topological space  $X$  is called  $\tilde{g}$ -interior (resp.  $\tilde{g}$ -closure) of  $S$  and it is denoted by  $\tilde{g}\text{-int}(S)$  (resp.  $\tilde{g}\text{-cl}(S)$ ).

A point  $x \in X$  is said to be a  $\theta$ -semi-cluster point [25] of a subset  $A$  of  $X$  if  $\text{cl}(U) \cap A \neq \phi$  for every semi-open set  $U$  containing  $x$ . The set of all  $\theta$ -semi-cluster points of  $A$  is called the  $\theta$ -semi-closure of  $A$  and is denoted by  $\theta\text{-s-cl}(A)$ . A subset  $A$  is called  $\theta$ -semi-closed [25] if  $A = \theta\text{-s-cl}(A)$ . The complement of a  $\theta$ -semi-closed set is called  $\theta$ -semi-open.

The family of all  $\delta$ -open (resp.  $\tilde{g}$ -open,  $\tilde{g}$ -closed,  $\pi g$ -open,  $\pi g$ -closed, regular open, regular closed, semi-open, closed) sets of  $X$  containing a point  $x \in X$  is

denoted by  $\delta O(X, x)$  (resp.  $\tilde{G}O(X, x)$ ,  $\tilde{G}C(X, x)$ ,  $\pi GO(X, x)$ ,  $\pi GC(X, x)$ ,  $RO(X, x)$ ,  $RC(X, x)$ ,  $SO(X, x)$ ,  $C(X, x)$ ). The family of all  $\delta$ -open (resp.  $\tilde{g}$ -open,  $\tilde{g}$ -closed,  $\pi g$ -open,  $\pi g$ -closed, semi-open,  $\beta$ -open, preopen, regular open, regular closed) sets of  $X$  is denoted by  $\delta O(X)$  (resp.  $\tilde{G}O(X)$ ,  $\tilde{G}C(X)$ ,  $\pi GO(X)$ ,  $\pi GC(X)$ ,  $SO(X)$ ,  $\beta O(X)$ ,  $PO(X)$ ,  $RO(X)$ ,  $RC(X)$ ).

**Definition 2.1.** A space  $X$  is said to be

1. *s-Urysohn* [3] if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exist  $U \in SO(X, x)$  and  $V \in SO(X, y)$  such that  $cl(U) \cap cl(V) = \phi$ ;
2. *weakly Hausdorff* [44] if each element of  $X$  is an intersection of regular closed sets.

**Definition 2.2**([20]). Let  $B$  be a subset of a space  $X$ . The set  $\cap \{A \in RO(X) : B \subset A\}$  is called the  $r$ -kernel of  $B$  and is denoted by  $r\text{-ker}(B)$ .

**Proposition 2.3**([20]). *The following properties hold for subsets  $A, B$  of a space  $X$ :*

1.  $x \in r\text{-ker}(A)$  if and only if  $A \cap K \neq \phi$  for any regular closed set  $K$  containing  $x$ .
2.  $A \subset r\text{-ker}(A)$  and  $A = r\text{-ker}(A)$  if  $A$  is regular open in  $X$ .
3. If  $A \subset B$ , then  $r\text{-ker}(A) \subset r\text{-ker}(B)$ .

**Lemma 2.4**([30]). *If  $V$  is an open set, then  $scl(V) = int(cl(V))$ .*

**Definition 2.5.** A space  $X$  is said to be

1. *S-closed* [47] if every regular closed cover of  $X$  has a finite subcover,
2. *Countably S-closed* [1] if every countable cover of  $X$  by regular closed sets has a finite subcover,
3. *S-Lindelof* [29] if every cover of  $X$  by regular closed sets has a countable subcover.

**Theorem 2.6**([23]). *Union (intersection) of any two  $\tilde{g}$ -closed sets is again  $\tilde{g}$ -closed.*

**Remark 2.7**([13, 23, 48]). We have the following relations:  $\text{closed} \Rightarrow \tilde{g}\text{-closed} \Rightarrow \hat{g}\text{-closed} \Rightarrow g\text{-closed} \Rightarrow \pi g\text{-closed}$ .

None of these implications are reversible.

The subset  $\{(x, f(x)) : x \in X\} \subset X \times Y$  is called the graph of a function  $f: X \rightarrow Y$  and is denoted by  $G(f)$ .

### 3. Characterizations of $\tilde{g}$ -open sets

**Lemma 3.1.** For any subset  $K$  of a topological space  $X$ ,  $X \setminus \tilde{g}\text{-cl}(K) = \tilde{g}\text{-int}(X \setminus K)$ .

**Lemma 3.2.** If a subset  $A$  is  $\tilde{g}$ -closed in a space  $X$ , then  $A = \tilde{g}\text{-cl}(A)$ .

**Lemma 3.3.** If  $A$  is  $\tilde{g}$ -closed and  $\#$ gs-open set, then  $A$  is closed.

**Theorem 3.4.** A set  $A$  is  $\tilde{g}$ -open in  $(X, \tau)$  if and only if  $F \subseteq \text{int}(A)$  whenever  $F$  is  $\#$ gs-closed in  $X$  and  $F \subseteq A$ .

*Proof.* Assume that  $A$  is  $\tilde{g}$ -open,  $F \subseteq A$  and  $F$  is  $\#$ gs-closed. Then  $X \setminus F$  is  $\#$ gs-open and  $X \setminus A \subseteq X \setminus F$ . Since  $X \setminus A$  is  $\tilde{g}$ -closed,  $\text{cl}(X \setminus A) \subseteq X \setminus F$ . It implies that  $X \setminus \text{int}(A) \subseteq X \setminus F$  and hence  $F \subseteq \text{int}(A)$ .

Conversely, put  $X \setminus A = B$ . Suppose  $B \subseteq U$  where  $U$  is  $\#$ gs-open. Now if  $X \setminus A \subseteq U$ , then  $F = X \setminus U \subseteq A$  and  $F$  is  $\#$ gs-closed. It implies that  $F \subseteq \text{int}(A)$  and hence  $X \setminus \text{int}(A) \subseteq X \setminus F = U$ . Therefore  $X \setminus \text{int}(X \setminus B) \subseteq U$  and consequently  $\text{cl}(B) \subseteq U$ . Hence  $B$  is  $\tilde{g}$ -closed and therefore  $A$  is  $\tilde{g}$ -open.  $\square$

**Theorem 3.5.** Suppose that  $A$  is  $\tilde{g}$ -open in  $X$  and that  $B$  is  $\tilde{g}$ -open in  $Y$ . Then  $A \times B$  is  $\tilde{g}$ -open in  $X \times Y$ .

*Proof.* Suppose that  $F$  is closed and hence  $\#$ gs-closed in  $X \times Y$  and that  $F \subseteq A \times B$ . By the previous theorem, it suffices to show that  $F \subseteq \text{int}(A \times B)$ .

Let  $(x, y) \in F$ . Then, for each  $(x, y) \in F$ ,  $\text{cl}(\{x\}) \times \text{cl}(\{y\}) = \text{cl}(\{x\} \times \{y\}) = \text{cl}(\{x, y\}) \subset \text{cl}(F) = F \subset A \times B$ . Two closed sets  $\text{cl}(\{x\})$  and  $\text{cl}(\{y\})$  are contained in  $A$  and  $B$  respectively. It follows from the assumption that  $\text{cl}(\{x\}) \subseteq \text{int}(A)$  and that  $\text{cl}(\{y\}) \subseteq \text{int}(B)$ . Thus  $(x, y) \in \text{cl}(\{x\}) \times \text{cl}(\{y\}) \subseteq \text{int}(A) \times \text{int}(B) \subseteq \text{int}(A \times B)$ . It means that, for each  $(x, y) \in F$ ,  $(x, y) \in \text{int}(A \times B)$  and hence  $F \subseteq \text{int}(A \times B)$ . Therefore  $A \times B$  is  $\tilde{g}$ -open in  $X \times Y$ .  $\square$

**Definition 3.6.** A function  $f: X \rightarrow Y$  is called  $\tilde{g}^*$ -closed [24] if  $f(V)$  is  $\tilde{g}$ -closed set in  $Y$  for each  $\tilde{g}$ -closed set  $V$  in  $X$ .

**Theorem 3.7([24]).** If a function  $f: X \rightarrow Y$  is  $\tilde{g}^*$ -closed, then for each subset  $B$  of  $Y$  and each  $\tilde{g}$ -open set  $U$  of  $X$  containing  $f^{-1}(B)$ , there exists a  $\tilde{g}$ -open set  $V$  in  $Y$  containing  $B$  such that  $f^{-1}(V) \subset U$ .

### 4. Properties of $(\tilde{g}, s)$ -continuous functions

**Definition 4.1.** A function  $f: X \rightarrow Y$  is called  $(\tilde{g}, s)$ -continuous if the inverse image of each regular open set of  $Y$  is  $\tilde{g}$ -closed in  $X$ .

**Theorem 4.2.** The following are equivalent for a function  $f: X \rightarrow Y$ :

1.  $f$  is  $(\tilde{g}, s)$ -continuous,
2. The inverse image of a regular closed set of  $Y$  is  $\tilde{g}$ -open in  $X$ ,

3.  $f^{-1}(\text{int}(\text{cl}(V)))$  is  $\tilde{g}$ -closed in  $X$  for every open subset  $V$  of  $Y$ ,
4.  $f^{-1}(\text{cl}(\text{int}(F)))$  is  $\tilde{g}$ -open in  $X$  for every closed subset  $F$  of  $Y$ ,
5.  $f^{-1}(\text{cl}(U))$  is  $\tilde{g}$ -open in  $X$  for every  $U \in \beta O(Y)$ ,
6.  $f^{-1}(\text{cl}(U))$  is  $\tilde{g}$ -open in  $X$  for every  $U \in \text{SO}(Y)$ ,
7.  $f^{-1}(\text{int}(\text{cl}(U)))$  is  $\tilde{g}$ -closed in  $X$  for every  $U \in \text{PO}(Y)$ .

*Proof.* (1)  $\Leftrightarrow$  (2) : Obvious

(1)  $\Leftrightarrow$  (3) : Let  $V$  be an open subset of  $Y$ . Since  $\text{int}(\text{cl}(V))$  is regular open,  $f^{-1}(\text{int}(\text{cl}(V)))$  is  $\tilde{g}$ -closed. The converse is similar.

(2)  $\Leftrightarrow$  (4) : Similar to (1)  $\Leftrightarrow$  (3)

(2)  $\Rightarrow$  (5) : Let  $U$  be any  $\beta$ -open set of  $Y$ . By Theorem 2.4 of [2] that  $\text{cl}(U)$  is regular closed. Then by (2)  $f^{-1}(\text{cl}(U))$  is  $\tilde{g}$ -open in  $X$ .

(5)  $\Rightarrow$  (6) : Obvious from the fact that  $\text{SO}(Y) \subset \beta O(Y)$ .

(6)  $\Rightarrow$  (7) : Let  $U \in \text{PO}(Y)$ . Then  $Y \setminus \text{int}(\text{cl}(U))$  is regular closed and hence it is semi-open. Then, we have  $X \setminus f^{-1}(\text{int}(\text{cl}(U))) = f^{-1}(Y \setminus \text{int}(\text{cl}(U))) = f^{-1}(\text{cl}(Y \setminus \text{int}(\text{cl}(U))))$  is  $\tilde{g}$ -open in  $X$ . Hence  $f^{-1}(\text{int}(\text{cl}(U)))$  is  $\tilde{g}$ -closed in  $X$ .

(7)  $\Rightarrow$  (1) : Let  $U$  be any regular open set of  $Y$ . Then  $U \in \text{PO}(Y)$  and hence  $f^{-1}(U) = f^{-1}(\text{int}(\text{cl}(U)))$  is  $\tilde{g}$ -closed in  $X$ .  $\square$

**Lemma 4.3([37]).** *For a subset  $A$  of a topological space  $(Y, \sigma)$  the following properties hold:*

1.  $\alpha \text{cl}(A) = \text{cl}(A)$  for every  $A \in \beta O(Y)$ ,
2.  $\text{pcl}(A) = \text{cl}(A)$  for every  $A \in \text{SO}(Y)$ ,
3.  $\text{scl}(A) = \text{int}(\text{cl}(A))$  for every  $A \in \text{PO}(Y)$ .

**Corollary 4.4.** *The following are equivalent for a function  $f: X \rightarrow Y$ :*

1.  $f$  is  $(\tilde{g}, s)$ -continuous,
2.  $f^{-1}(\alpha \text{cl}(A))$  is  $\tilde{g}$ -open in  $X$  for every  $A \in \beta O(Y)$ ,
3.  $f^{-1}(\text{pcl}(A))$  is  $\tilde{g}$ -open in  $X$  for every  $A \in \text{SO}(Y)$ ,
4.  $f^{-1}(\text{scl}(A))$  is  $\tilde{g}$ -closed in  $X$  for every  $A \in \text{PO}(Y)$ .

*Proof.* It follows from Lemma 4.3.  $\square$

**Theorem 4.5.** *Suppose that  $\tilde{G}C(X)$  is closed under arbitrary intersections. The following are equivalent for a function  $f: X \rightarrow Y$ :*

1.  $f$  is  $(\tilde{g}, s)$ -continuous,
2. the inverse image of a  $\theta$ -semi-open set of  $Y$  is  $\tilde{g}$ -open,
3. the inverse image of a  $\theta$ -semi-closed set of  $Y$  is  $\tilde{g}$ -closed,
4.  $f(\tilde{g}\text{-cl}(U)) \subset \text{r-ker}(f(U))$  for every subset  $U$  of  $X$ ,

5.  $\tilde{g}\text{-cl}(f^{-1}(V)) \subset f^{-1}(\text{r-ker}(V))$  for every subset  $V$  of  $Y$ ,
6. for each  $x \in X$  and each  $V \in \text{SO}(Y, f(x))$ , there exists a  $\tilde{g}$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subset \text{cl}(V)$ ,
7.  $f^{-1}(V) \subset \tilde{g}\text{-int}(f^{-1}(\text{cl}(V)))$  for every  $V \in \text{SO}(Y)$ ,
8.  $f(\tilde{g}\text{-cl}(A)) \subset \theta\text{-s-cl}(f(A))$  for every subset  $A$  of  $X$ ,
9.  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$  for every subset  $B$  of  $Y$ ,
10.  $\tilde{g}\text{-cl}(f^{-1}(V)) \subseteq f^{-1}(\theta\text{-s-cl}(V))$  for every open subset  $V$  of  $Y$ ,
11.  $\tilde{g}\text{-cl}(f^{-1}(V)) \subseteq f^{-1}(\text{scl}(V))$  for every open subset  $V$  of  $Y$ ,
12.  $\tilde{g}\text{-cl}(f^{-1}(V)) \subseteq f^{-1}(\text{int}(\text{cl}(V)))$  for every open subset  $V$  of  $Y$ .

*Proof.* (1)  $\Rightarrow$  (2): Since any  $\theta$ -semi-open set is a union of regular closed sets, by using Theorem 4.2, (2) holds.

(2)  $\Rightarrow$  (6): Let  $x \in X$  and  $V \in \text{SO}(Y)$  containing  $f(x)$ . Since  $\text{cl}(V)$  is  $\theta$ -semi-open in  $Y$ , there exists a  $\tilde{g}$ -open set  $U$  in  $X$  containing  $x$  such that  $x \in U \subset f^{-1}(\text{cl}(V))$ . Hence  $f(U) \subset \text{cl}(V)$ .

(6)  $\Rightarrow$  (7): Let  $V \in \text{SO}(Y)$  and  $x \in f^{-1}(V)$ . Then  $f(x) \in V$ . By (6), there exists a  $\tilde{g}$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subset \text{cl}(V)$ . It follows that  $x \in U \subset f^{-1}(\text{cl}(V))$ . Hence  $x \in \tilde{g}\text{-int}(f^{-1}(\text{cl}(V)))$ . Thus,  $f^{-1}(V) \subset \tilde{g}\text{-int}(f^{-1}(\text{cl}(V)))$ .

(7)  $\Rightarrow$  (1): Let  $F$  be any regular closed set of  $Y$ . Since  $F \in \text{SO}(Y)$ , then by (7),  $f^{-1}(F) \subset \tilde{g}\text{-int}(f^{-1}(F))$ . This shows that  $f^{-1}(F)$  is  $\tilde{g}$ -open in  $X$ . Hence, by Theorem 4.2, (1) holds.

(2)  $\Leftrightarrow$  (3) : Obvious.

(1)  $\Rightarrow$  (4): Let  $U$  be any subset of  $X$ . Let  $y \notin \text{r-ker}(f(U))$ . Then there exists a regular closed set  $F$  containing  $y$  such that  $f(U) \cap F = \phi$ . Hence, we have  $U \cap f^{-1}(F) = \phi$  and  $\tilde{g}\text{-cl}(U) \cap f^{-1}(F) = \phi$ . Therefore, we obtain  $f(\tilde{g}\text{-cl}(U)) \cap F = \phi$  and  $y \notin f(\tilde{g}\text{-cl}(U))$ . Thus,  $f(\tilde{g}\text{-cl}(U)) \subset \text{r-ker}(f(U))$ .

(4)  $\Rightarrow$  (5): Let  $V$  be any subset of  $Y$ . By (4),  $f(\tilde{g}\text{-cl}(f^{-1}(V))) \subset \text{r-ker}(V)$  and  $\tilde{g}\text{-cl}(f^{-1}(V)) \subset f^{-1}(\text{r-ker}(V))$ .

(5)  $\Rightarrow$  (1): Let  $V$  be any regular open set of  $Y$ . By (5),  $\tilde{g}\text{-cl}(f^{-1}(V)) \subset f^{-1}(\text{r-ker}(V)) = f^{-1}(V)$  and  $\tilde{g}\text{-cl}(f^{-1}(V)) = f^{-1}(V)$ . We obtain that  $f^{-1}(V)$  is  $\tilde{g}$ -closed in  $X$ .

(6)  $\Rightarrow$  (8): Let  $A$  be any subset of  $X$ . Suppose that  $x \in \tilde{g}\text{-cl}(A)$  and  $G$  is any semi-open set of  $Y$  containing  $f(x)$ . By (6), there exists  $U \in \tilde{G}\text{O}(X, x)$  such that  $f(U) \subset \text{cl}(G)$ . Since  $x \in \tilde{g}\text{-cl}(A)$ ,  $U \cap A \neq \phi$  and hence  $\phi \neq f(U) \cap f(A) \subset \text{cl}(G) \cap f(A)$ . Therefore, we obtain  $f(x) \in \theta\text{-s-cl}(f(A))$  and hence  $f(\tilde{g}\text{-cl}(A)) \subset \theta\text{-s-cl}(f(A))$ .

(8)  $\Rightarrow$  (9): Let  $B$  be any subset of  $Y$ . Then  $f(\tilde{g}\text{-cl}(f^{-1}(B))) \subset \theta\text{-s-cl}(f(f^{-1}(B))) \subset \theta\text{-s-cl}(B)$  and  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$ .

(9)  $\Rightarrow$  (6): Let  $V$  be any semi-open set of  $Y$  containing  $f(x)$ . Since  $\text{cl}(V) \cap (Y \setminus \text{cl}(V)) = \phi$ , we have  $f(x) \notin \theta\text{-s-cl}(Y \setminus \text{cl}(V))$  and  $x \notin f^{-1}(\theta\text{-s-cl}(Y \setminus \text{cl}(V)))$ . By (9),  $x \notin \tilde{g}\text{-cl}(f^{-1}(Y \setminus \text{cl}(V)))$ . Hence, there exists  $U \in \tilde{G}\text{O}(X, x)$  such that  $U \cap f^{-1}(Y \setminus \text{cl}(V)) = \phi$  and  $f(U) \cap (Y \setminus \text{cl}(V)) = \phi$ . It follows that  $f(U) \subset \text{cl}(V)$ . Thus, (6) holds.

- (9)  $\Rightarrow$  (10): Obvious.
- (10)  $\Rightarrow$  (11): Obvious from the fact that  $\theta$ -s-cl(V) = scl(V) for an open set V.
- (11)  $\Rightarrow$  (12): Obvious from Lemma 2.4.
- (12)  $\Rightarrow$  (1): Let  $V \in \text{RO}(Y)$ . Then by (12)  $\tilde{g}\text{-cl}(f^{-1}(V)) \subset f^{-1}(\text{int}(\text{cl}(V))) = f^{-1}(V)$ . Hence,  $f^{-1}(V)$  is  $\tilde{g}$ -closed which proves that  $f$  is  $(\tilde{g}, s)$ -continuous.  $\square$

**Corollary 4.6.** *Assume that  $\tilde{G}C(X)$  is closed under arbitrary intersections. The following are equivalent for a function  $f: X \rightarrow Y$ :*

1.  $f$  is  $(\tilde{g}, s)$ -continuous,
2.  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$  for every  $B \in \text{SO}(Y)$ ,
3.  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$  for every  $B \in \text{PO}(Y)$ ,
4.  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$  for every  $B \in \beta O(Y)$ .

*Proof.* In Theorem 4.5, we have proved that the following are equivalent.

1.  $f$  is  $(\tilde{g}, s)$ -continuous.
2.  $\tilde{g}\text{-cl}(f^{-1}(B)) \subset f^{-1}(\theta\text{-s-cl}(B))$  for every subset  $B$  of  $Y$ .

Hence the corollary is proved.  $\square$

### 5. The related functions with $(\tilde{g}, s)$ -continuous functions

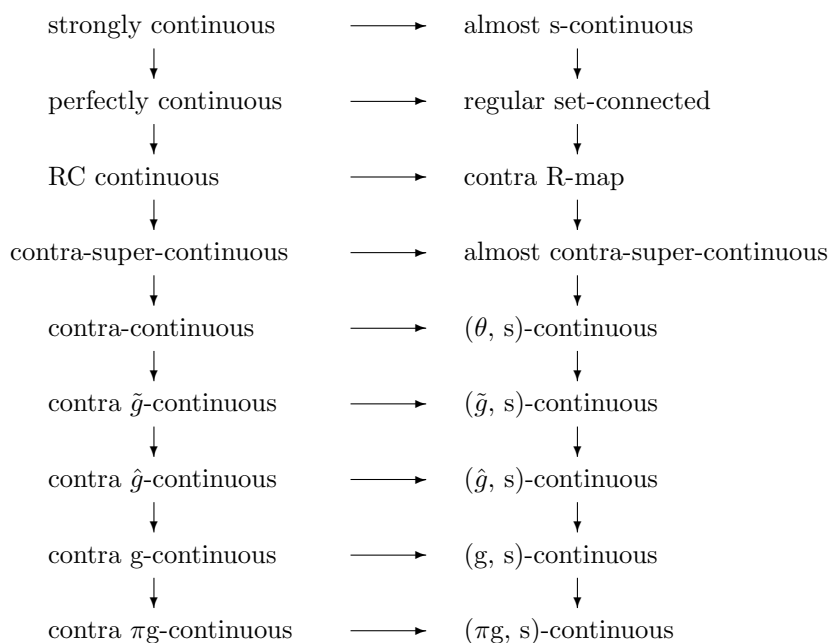

**Definition 5.1.** A function  $f: X \rightarrow Y$  is said to be

1. *perfectly continuous* [35] if  $f^{-1}(V)$  is clopen in  $X$  for every open set  $V$  of  $Y$ ,
2. *regular set-connected* [12, 16] if  $f^{-1}(V)$  is clopen in  $X$  for every  $V \in \text{RO}(Y)$ ,
3. *almost  $s$ -continuous* [6, 38] if for each  $x \in X$  and each  $V \in \text{SO}(Y, f(x))$ , there exists an open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subset \text{scl}(V)$ ,
4. *strongly continuous* [26] if the inverse image of every set in  $Y$  is clopen in  $X$ ,
5. *RC-continuous* [11] if  $f^{-1}(V)$  is regular closed in  $X$  for each open set  $V$  of  $Y$ ,
6. *contra  $R$ -map* [17] if  $f^{-1}(V)$  is regular closed in  $X$  for each regular open set  $V$  of  $Y$ ,
7. *contra-super-continuous* [22] if for each  $x \in X$  and for each  $F \in C(Y, f(x))$ , there exists a regular open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subset F$ ,
8. *almost contra-super-continuous* [15] if  $f^{-1}(V)$  is  $\delta$ -closed in  $X$  for every regular open set  $V$  of  $Y$ ,
9. *contra continuous* [10] if  $f^{-1}(V)$  is closed in  $X$  for every open set  $V$  of  $Y$ ,
10. *contra  $g$ -continuous* [5] if  $f^{-1}(V)$  is  $g$ -closed in  $X$  for every open set  $V$  of  $Y$ ,

11.  $(\theta, s)$ -continuous [25, 39] if for each  $x \in X$  and each  $V \in \text{SO}(Y, f(x))$ , there exists an open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subset \text{cl}(V)$ ,
12. *contra*  $\pi g$ -continuous [19] if  $f^{-1}(V)$  is  $\pi g$ -closed in  $X$  for each open set  $V$  of  $Y$ ,
13.  $\hat{g}$ -continuous [48] if  $f^{-1}(V)$  is  $\hat{g}$ -closed in  $X$  for each closed set  $V$  of  $Y$ ,
14.  $\tilde{g}$ -continuous [24] if  $f^{-1}(V)$  is  $\tilde{g}$ -closed in  $X$  for each closed set  $V$  of  $Y$ ,
15.  $(g, s)$ -continuous [14] if  $f^{-1}(V)$  is  $g$ -closed in  $X$  for each regular open set  $V$  of  $Y$ ,
16.  $(\hat{g}, s)$ -continuous [43] if  $f^{-1}(V)$  is  $\hat{g}$ -closed in  $X$  for each regular open set  $V$  of  $Y$ ,
17.  $(\pi g, s)$ -continuous [14] if  $f^{-1}(V)$  is  $\pi g$ -closed in  $X$  for each regular open set  $V$  of  $Y$ .

**Definition 5.2.** A function  $f: X \rightarrow Y$  is said to be *contra*  $\hat{g}$ -continuous [43] (resp. *contra*  $\tilde{g}$ -continuous) if  $f^{-1}(V)$  is  $\hat{g}$ -closed (resp.  $\tilde{g}$ -closed) in  $X$  for each open set  $V$  of  $Y$ .

**Remark 5.3.** The following diagram holds for a function  $f: X \rightarrow Y$ :

None of these implications is reversible as shown in the following examples and in the related paper [43].

**Example 5.4.** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{b\}, \{a, c\}\}$  and  $\sigma = \{\phi, Y, \{a, b\}\}$ . Then the identity function  $f: X \rightarrow Y$  is  $(\tilde{g}, s)$ -continuous but it is not contra  $\tilde{g}$ -continuous.

**Example 5.5.** Let  $X = Y = \{a, b, c\}$ ,  $\tau = \{\phi, X, \{a\}, \{b, c\}\}$  and  $\sigma = \{\phi, Y, \{a, b\}\}$ . Then the identity function  $f: X \rightarrow Y$  is contra  $\hat{g}$ -continuous but it is not contra  $\tilde{g}$ -continuous.

**Example 5.6.** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \sigma = \{\phi, X = Y, \{b\}, \{a, c, d\}\}$ . Then the function  $f: X \rightarrow Y$  which is defined as  $f(a) = b, f(b) = c, f(c) = d, f(d) = a$  is  $(\hat{g}, s)$ -continuous but it is not  $(\tilde{g}, s)$ -continuous.

**Example 5.7.** Let  $X = Y = \{a, b, c, d\}$ ,  $\tau = \sigma = \{\phi, X = Y, \{c\}, \{a, d\}, \{a, c, d\}\}$ . Then the function  $f: X \rightarrow Y$  which is defined as  $f(a) = c, f(b) = c, f(c) = b, f(d) = b$  is  $(\tilde{g}, s)$ -continuous but it is not  $(\theta, s)$ -continuous.

Let  $X = \{a, b, c, d\} = Y$ ,  $\tau = \{\phi, X, \{b\}, \{b, c\}, \{b, c, d\}\}$  and  $\sigma = \{\phi, Y, \{a\}, \{a, b\}\}$ . Then the identity function  $f: X \rightarrow Y$  is contra  $\tilde{g}$ -continuous but it is not contra continuous.

A topological space  $(X, \tau)$  is said to be extremely disconnected [4] if the closure of every open set of  $X$  is open in  $X$ .

**Definition 5.8.** A function  $f: X \rightarrow Y$  is said to be almost  $\tilde{g}$ -continuous if  $f^{-1}(V)$  is  $\tilde{g}$ -open in  $X$  for every regular open set  $V$  of  $Y$ .

**Theorem 5.9.** Let  $(Y, \sigma)$  be extremely disconnected. Then, the following are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ :

1.  $f$  is  $(\tilde{g}, s)$ -continuous,
2.  $f$  is almost  $\tilde{g}$ -continuous.

*Proof.* (1)  $\Rightarrow$  (2): Let  $x \in X$  and  $U$  be any regular open set of  $Y$  containing  $f(x)$ . Since  $Y$  is extremely disconnected, by lemma 5.6 of [41]  $U$  is clopen and hence  $U$  is regular closed. Then  $f^{-1}(U)$  is  $\tilde{g}$ -open in  $X$ . Thus,  $f$  is almost  $\tilde{g}$ -continuous.

(2)  $\Rightarrow$  (1): Let  $K$  be any regular closed set of  $Y$ . Since  $Y$  is extremely disconnected,  $K$  is regular open and  $f^{-1}(K)$  is  $\tilde{g}$ -open in  $X$ . Thus,  $f$  is  $(\tilde{g}, s)$ -continuous.  $\square$

**Definition 5.10.** A space is said to be  $P_\Sigma$  [52] or strongly  $s$ -regular [21] if for any open set  $V$  of  $X$  and each  $x \in V$ , there exists  $K \in RC(X, x)$  such that  $x \in K \subset V$ .

**Definition 5.11.** A space  $(X, \tau)$  is called  $\tilde{g}$ - $T_{1/2}$  if every  $\tilde{g}$ -closed set is closed.

**Theorem 5.12.** Let  $f: X \rightarrow Y$  be a function from a  $\tilde{g}$ - $T_{1/2}$ -space  $X$  to a topological space  $Y$ . The following are equivalent.

1.  $f$  is  $(\theta, s)$ -continuous,
2.  $f$  is  $(\tilde{g}, s)$ -continuous.

**Theorem 5.13.** *Let  $f: X \rightarrow Y$  be a function. Then, if  $f$  is  $(\tilde{g}, s)$ -continuous,  $X$  is  $\tilde{g}$ - $T_{1/2}$  and  $Y$  is  $P_\Sigma$ , then  $f$  is continuous.*

*Proof.* Let  $G$  be any open set of  $Y$ . Since  $Y$  is  $P_\Sigma$ , there exists a subfamily  $\Phi$  of  $RC(Y)$  such that  $G = \cup \{A: A \in \Phi\}$ . Since  $X$  is  $\tilde{g}$ - $T_{1/2}$  and  $f$  is  $(\tilde{g}, s)$ -continuous,  $f^{-1}(A)$  is open in  $X$  for each  $A \in \Phi$  and  $f^{-1}(G)$  is open in  $X$ . Thus,  $f$  is continuous.

**Theorem 5.14.** *Let  $f: X \rightarrow Y$  be a function from a  $\tilde{g}$ - $T_{1/2}$ -space  $(X, \tau)$  to an extremely disconnected space  $(Y, \sigma)$ . Then the following are equivalent.*

1.  $f$  is  $(\tilde{g}, s)$ -continuous.
2.  $f$  is  $(\theta, s)$ -continuous.
3.  $f$  is almost contra-super-continuous.
4.  $f$  is contra  $R$ -map.
5.  $f$  is regular set-connected.
6.  $f$  is almost  $s$ -continuous.

*Proof.* (6)  $\Rightarrow$  (5)  $\Rightarrow$  (4)  $\Rightarrow$  (3)  $\Rightarrow$  (2)  $\Rightarrow$  (1): Obvious.

(1)  $\Rightarrow$  (6) Let  $V$  be any semi-open and semi-closed set of  $Y$ . Since  $V$  is semi-open,  $cl(V) = cl(int(V))$  and hence  $cl(V)$  is open in  $Y$ . Since  $V$  is semi-closed,  $int(cl(V)) \subset V \subset cl(V)$  and hence  $int(cl(V)) = V = cl(V)$ . Therefore,  $V$  is clopen in  $Y$  and  $V \in RO(Y) \cap RC(Y)$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous,  $f^{-1}(V)$  is  $\tilde{g}$ -open and  $\tilde{g}$ -closed in  $X$ . Since  $X$  is  $\tilde{g}$ - $T_{1/2}$ -space,  $\tau = \tilde{G}O(X)$ . Thus,  $f^{-1}(V)$  is clopen in  $X$  and hence  $f$  is almost  $s$ -continuous [38, Theorem 3.1].  $\square$

**Definition 5.15.** A space is said to be weakly  $P_\Sigma$  [36] if for any  $V \in RO(X)$  and each  $x \in V$ , there exists  $F \in RC(X, x)$  such that  $x \in F \subset V$ .

**Theorem 5.16.** *Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be a  $(\tilde{g}, s)$ -continuous function and  $\tilde{G}C(X)$  be closed under arbitrary intersections. If  $Y$  is weakly  $P_\Sigma$  and  $X$  is  $\tilde{g}$ - $T_{1/2}$ , then  $f$  is regular set-connected.*

*Proof.* Let  $V$  be any regular open set of  $Y$ . Since  $Y$  is weakly  $P_\Sigma$ , there exists a subfamily  $\Phi$  of  $RC(Y)$  such that  $V = \cup \{A: A \in \Phi\}$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous,  $f^{-1}(A)$  is  $\tilde{g}$ -open in  $X$  for each  $A \in \Phi$  and  $f^{-1}(V)$  is  $\tilde{g}$ -open in  $X$ . Also  $f^{-1}(V)$  is  $\tilde{g}$ -closed in  $X$  since  $f$  is  $(\tilde{g}, s)$ -continuous. Since  $X$  is  $\tilde{g}$ - $T_{1/2}$  space, then  $\tau = \tilde{G}O(X)$ . Hence  $f^{-1}(V)$  is clopen in  $X$  and then  $f$  is regular set-connected.  $\square$

**Definition 5.17.** A function  $f: X \rightarrow Y$  is said to be  $\tilde{g}$ -irresolute [24] if  $f^{-1}(V)$  is  $\tilde{g}$ -open in  $X$  for every  $V \in \tilde{G}O(X)$ .

**Theorem 5.18.** *Let  $f: X \rightarrow Y$  and  $g: Y \rightarrow Z$  be functions. Then, the following properties hold:*

1. If  $f$  is  $\tilde{g}$ -irresolute and  $g$  is  $(\tilde{g}, s)$ -continuous, then  $g \circ f: X \rightarrow Z$  is  $(\tilde{g}, s)$ -continuous.
2. If  $f$  is  $(\tilde{g}, s)$ -continuous and  $g$  is contra R-map, then  $g \circ f: X \rightarrow Z$  is almost  $\tilde{g}$ -continuous.
3. If  $f$  is  $\tilde{g}$ -continuous and  $g$  is  $(\theta, s)$ -continuous, then  $g \circ f: X \rightarrow Z$  is  $(\tilde{g}, s)$ -continuous.
4. If  $f$  is  $(\tilde{g}, s)$ -continuous and  $g$  is RC continuous, then  $g \circ f: X \rightarrow Z$  is  $\tilde{g}$ -continuous.
5. If  $f$  is almost  $\tilde{g}$ -continuous and  $g$  is contra R-map, then  $g \circ f: X \rightarrow Z$  is  $(\tilde{g}, s)$ -continuous.

**Theorem 5.19.** *Let  $Y$  be a regular space and  $f: X \rightarrow Y$  be a function. Suppose that the collection of  $\tilde{g}$ -closed sets of  $X$  is closed under arbitrary intersections. Then if  $f$  is  $(\tilde{g}, s)$ -continuous,  $f$  is  $\tilde{g}$ -continuous.*

*Proof.* Let  $x$  be an arbitrary point of  $X$  and  $V$  an open set of  $Y$  containing  $f(x)$ . Since  $Y$  is regular, there exists an open set  $G$  in  $Y$  containing  $f(x)$  such that  $\text{cl}(G) \subset V$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous, there exists  $U \in \tilde{G}O(X, x)$  such that  $f(U) \subset \text{cl}(G)$ . Then  $f(U) \subset \text{cl}(G) \subset V$ . Hence,  $f$  is  $\tilde{g}$ -continuous.  $\square$

## 6. Fundamental properties

**Definition 6.1**([24]). A space  $X$  is said to be

1.  $\tilde{g}$ - $T_2$  if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exist  $U \in \tilde{G}O(X, x)$  and  $V \in \tilde{G}O(X, y)$  such that  $U \cap V = \phi$ .
2.  $\tilde{g}$ - $T_1$  if for each pair of distinct points  $x$  and  $y$  in  $X$ , there exist  $\tilde{g}$ -open sets  $U$  and  $V$  containing  $x$  and  $y$ , respectively, such that  $y \notin U$  and  $x \notin V$ .

**Remark 6.2.** The following implications are hold for a topological space  $X$ .

1.  $T_2 \Rightarrow \tilde{g}$ - $T_2$
2.  $T_1 \Rightarrow \tilde{g}$ - $T_1$

These implications are not reversible.

**Example 6.3.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, X, \{a\}, \{b\}, \{c\}, \{a, b\}, \{a, c\}, \{b, c\}\}$ . Then  $X$  is both  $\tilde{g}$ - $T_2$  and  $\tilde{g}$ - $T_1$  but it is neither  $T_1$  nor  $T_2$ .

**Theorem 6.4.** *The following properties hold for a function  $f: X \rightarrow Y$ :*

1. If  $f$  is a  $(\tilde{g}, s)$ -continuous injection and  $Y$  is  $s$ -Urysohn, then  $X$  is  $\tilde{g}$ - $T_2$ .
2. If  $f$  is a  $(\tilde{g}, s)$ -continuous injection and  $Y$  is weakly Hausdorff, then  $X$  is  $\tilde{g}$ - $T_1$ .

*Proof.* (1) Let  $Y$  be  $s$ -Urysohn. By the injectivity of  $f$ ,  $f(x) \neq f(y)$  for any distinct points  $x$  and  $y$  in  $X$ . Since  $Y$  is  $s$ -Urysohn, there exist  $A \in \text{SO}(Y, f(x))$  and  $B \in \text{SO}(Y, f(y))$  such that  $\text{cl}(A) \cap \text{cl}(B) = \phi$ . Since  $f$  is a  $(\tilde{g}, s)$ -continuous, by theorem 4.5, there exist  $\tilde{g}$ -open sets  $C$  and  $D$  in  $X$  containing  $x$  and  $y$ , respectively, such that  $f(C) \subset \text{cl}(A)$  and  $f(D) \subset \text{cl}(B)$  such that  $C \cap D = \phi$ . Thus,  $X$  is  $\tilde{g}$ - $T_2$ .

(2) Let  $Y$  be weakly Hausdorff. For  $x \neq y$  in  $X$ , there exist  $A, B \in \text{RC}(Y)$  such that  $f(x) \in A$ ,  $f(y) \notin A$ ,  $f(x) \notin B$  and  $f(y) \in B$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous,  $f^{-1}(A)$  and  $f^{-1}(B)$  are  $\tilde{g}$ -open subsets of  $X$  such that  $x \in f^{-1}(A)$ ,  $y \notin f^{-1}(A)$ ,  $x \notin f^{-1}(B)$  and  $y \in f^{-1}(B)$ . Hence,  $X$  is  $\tilde{g}$ - $T_1$ .  $\square$

**Theorem 6.5([24]).** *A space  $X$  is  $\tilde{g}$ - $T_2$  if and only if for any pair of distinct points  $x, y$  of  $X$  there exist  $\tilde{g}$ -open sets  $U$  and  $V$  such that  $x \in U$  and  $y \in V$  and  $\tilde{g}\text{-cl}(U) \cap \tilde{g}\text{-cl}(V) = \phi$ .*

**Definition 6.6.** A graph  $G(f)$  of a function  $f: X \rightarrow Y$  is said to be  $(\tilde{g}, s)$ -graph if there exist a  $\tilde{g}$ -open set  $A$  in  $X$  containing  $x$  and a semi-open set  $B$  in  $Y$  containing  $y$  such that  $(A \times \text{cl}(B)) \cap G(f) = \phi$  for each  $(x, y) \in (X \times Y) \setminus G(f)$ .

**Proposition 6.7.** *The following properties are equivalent for a function  $f: X \rightarrow Y$ :*

1.  $G(f)$  is  $(\tilde{g}, s)$ -graph,
2. For each  $(x, y) \in (X \times Y) \setminus G(f)$ , there exist a  $\tilde{g}$ -open set  $A$  in  $X$  containing  $x$  and a semi-open set  $B$  in  $Y$  containing  $y$  such that  $f(A) \cap \text{cl}(B) = \phi$ .
3. For each  $(x, y) \in (X \times Y) \setminus G(f)$ , there exist a  $\tilde{g}$ -open set  $A$  in  $X$  containing  $x$  and a regular closed set  $K$  in  $Y$  containing  $y$  such that  $f(A) \cap K = \phi$ .

**Definition 6.8.** A subset  $S$  of a space  $X$  is said to be  $S$ -closed relative to  $X$  [34] if for every cover  $\{A_i: i \in I\}$  of  $S$  by semi-open sets of  $X$ , there exists a finite subset  $I_0$  of  $I$  such that  $S \subset \cup\{\text{cl}(A_i) : i \in I_0\}$ .

**Theorem 6.9.** *If a function  $f: X \rightarrow Y$  has a  $(\tilde{g}, s)$ -graph and the collection of  $\tilde{g}$ -closed sets of  $X$  is closed under arbitrary intersections, then  $f^{-1}(A)$  is  $\tilde{g}$ -closed in  $X$  for every subset  $A$  which is  $S$ -closed relative to  $Y$ .*

*Proof.* Suppose that  $A$  is  $S$ -closed relative to  $Y$  and  $x \notin f^{-1}(A)$ . We have  $(x, y) \in (X \times Y) \setminus G(f)$  for each  $y \in A$  and there exist a  $\tilde{g}$ -open set  $B_y$  containing  $x$  and a semi-open set  $C_y$  containing  $y$  such that  $f(B_y) \cap \text{cl}(C_y) = \phi$ . Since  $\{C_y: y \in A\}$  is a cover by semi-open sets of  $Y$ , there exists a finite subset  $\{y_1, y_2, \dots, y_n\}$  of  $A$  such that  $A \subset \cup\{\text{cl}(C_{y_i}): i = 1, 2, \dots, n\}$ . Take  $B = \cup\{B_{y_i} : i = 1, 2, \dots, n\}$ . Then  $B$  is a  $\tilde{g}$ -open containing  $x$  and  $f(B) \cap A = \phi$ . Thus,  $B \cap f^{-1}(A) = \phi$  and hence  $f^{-1}(A)$  is  $\tilde{g}$ -closed in  $X$ .  $\square$

**Theorem 6.10.** *Let  $f: X \rightarrow Y$  be a  $(\tilde{g}, s)$ -continuous function. Then the following properties hold:*

1.  $G(f)$  is a  $(\tilde{g}, s)$ -graph if  $Y$  is an  $s$ -Urysohn.

2.  $f$  is almost  $\tilde{g}$ -continuous if  $Y$  is  $s$ -Urysohn  $S$ -closed space and  $\tilde{G}C(X)$  is closed under arbitrary intersections.

*Proof.* (1) Let  $Y$  be  $s$ -Urysohn and  $(x, y) \in (X \times Y) \setminus G(f)$ . Then  $f(x) \neq y$ . Since  $Y$  is  $s$ -Urysohn, there exist  $M \in SO(Y, f(x))$  and  $N \in SO(Y, y)$  such that  $cl(M) \cap cl(N) = \phi$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous, by theorem there exists a  $\tilde{g}$ -open set  $A$  in  $X$  containing  $x$  such that  $f(A) \subset cl(M)$ . Hence,  $f(A) \cap cl(N) = \phi$  and  $G(f)$  is  $(\tilde{g}, s)$ -graph in  $X \times Y$ .

(2) Let  $F$  be a regular closed set in  $Y$ . By theorem 3.3 and 3.4 [34],  $F$  is  $S$ -closed relative to  $Y$ . Hence, by theorem 6.9 and (1),  $f^{-1}(F)$  is  $\tilde{g}$ -closed in  $X$  and hence  $f$  is almost  $\tilde{g}$ -continuous. □

**Theorem 6.11.** *Let  $f, g: X \rightarrow Y$  be functions and  $\tilde{g}\text{-cl}(S)$  be  $\tilde{g}$ -closed for each  $S \subset X$ . If*

1.  $f$  and  $g$  are  $(\tilde{g}, s)$ -continuous,
2.  $Y$  is  $s$ -Urysohn,

*then  $A = \{x \in X : f(x) = g(x)\}$  is  $\tilde{g}$ -closed in  $X$ .*

*Proof.* Let  $x \in X \setminus A$ , then it follows that  $f(x) \neq g(x)$ . Since  $Y$  is  $s$ -Urysohn, there exist  $M \in SO(Y, f(x))$  and  $N \in SO(Y, g(x))$  such that  $cl(M) \cap cl(N) = \phi$ . Since  $f$  and  $g$  are  $(\tilde{g}, s)$ -continuous, there exist  $\tilde{g}$ -open sets  $U$  and  $V$  containing  $x$  such that  $f(U) \subset cl(M)$  and  $g(V) \subset cl(N)$ . Hence,  $U \cap V = P \in \tilde{G}O(X)$ ,  $f(P) \cap g(P) = \phi$  and then  $x \notin \tilde{g}\text{-cl}(A)$ . Thus,  $A$  is  $\tilde{g}$ -closed in  $X$ . □

**Definition 6.12.** A subset  $A$  of a topological space  $X$  is said to be  $\tilde{g}$ -dense in  $X$  if  $\tilde{g}\text{-cl}(A) = X$ .

**Theorem 6.13.** *Let  $f, g: X \rightarrow Y$  be functions and  $\tilde{g}\text{-cl}(S)$  be  $\tilde{g}$ -closed for each  $S \subset X$ . If*

1.  $Y$  is  $s$ -Urysohn,
2.  $f$  and  $g$  are  $(\tilde{g}, s)$ -continuous,
3.  $f = g$  on  $\tilde{g}$ -dense set  $A \subset X$ , then  $f = g$  on  $X$ .

*Proof.* Since  $f$  and  $g$  are  $(\tilde{g}, s)$ -continuous and  $Y$  is  $s$ -Urysohn, by Theorem 6.11,  $B = \{x \in X : f(x) = g(x)\}$  is  $\tilde{g}$ -closed in  $X$ . We have  $f = g$  on  $\tilde{g}$ -dense set  $A \subset X$ . Since  $A \subset B$  and  $A$  is  $\tilde{g}$ -dense set in  $X$ , then  $X = \tilde{g}\text{-cl}(A) \subset \tilde{g}\text{-cl}(B) = B$ . Hence  $f = g$  on  $X$ . □

**Definition 6.14([24]).** A space  $X$  is said to be

1. countably  $\tilde{g}$ -compact if every countable cover of  $X$  by  $\tilde{g}$ -open sets has a finite subcover,
2.  $\tilde{g}$ -Lindelof if every  $\tilde{g}$ -open cover of  $X$  has a countable subcover.

**Theorem 6.15.** *Let  $f: X \rightarrow Y$  be a  $(\tilde{g}, s)$ -continuous surjection. Then the following statements hold:*

1. if  $X$  is  $\tilde{g}$ -Lindelof, then  $Y$  is S-Lindelof.
2. if  $X$  is countably  $\tilde{g}$ -compact, then  $Y$  is countably S-closed.

**Definition 6.16.** A space  $X$  is called  $\tilde{g}$ -connected if  $X$  is not the union of two disjoint nonempty  $\tilde{g}$ -open sets.

**Example 6.17.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, X, \{a\}, \{b, c\}\}$ . Then  $X$  is not  $\tilde{g}$ -connected.

**Example 6.18.** Let  $X = \{a, b, c\}$  with  $\tau = \{\phi, X, \{a\}, \{a, b\}\}$ . Then  $X$  is  $\tilde{g}$ -connected.

**Theorem 6.19.** *Let  $f: X \rightarrow Y$  be a  $(\tilde{g}, s)$ -continuous surjection. If  $X$  is  $\tilde{g}$ -connected, then  $Y$  is connected.*

*Proof.* Assume that  $Y$  is not connected space. Then there exist nonempty disjoint open sets  $A$  and  $B$  such that  $Y = A \cup B$ . Also  $A$  and  $B$  are clopen in  $Y$ . Since  $f$  is  $(\tilde{g}, s)$ -continuous,  $f^{-1}(A)$  and  $f^{-1}(B)$  are  $\tilde{g}$ -open in  $X$ . Moreover  $f^{-1}(A)$  and  $f^{-1}(B)$  are nonempty disjoint and  $X = f^{-1}(A) \cup f^{-1}(B)$ . This shows that  $X$  is not  $\tilde{g}$ -connected. This contradicts the assumption that  $Y$  is not connected.  $\square$
