ON POLARS OF MIXED COMPLEX PROJECTION BODIES

LIJUAN LIU, WEI WANG, AND QINGZHONG HUANG

ABSTRACT. In this paper we establish general Minkowski inequality, Aleksandrov-Fenchel inequality and Brunn-Minkowski inequality for polars of mixed complex projection bodies.

1. Introduction

The projection body of a convex body in $\mathbb{R}^n$ is one of the central notions that Minkowski introduced within convex geometry. Projection bodies and their polars have received considerable attention over the past few decades (see [3, 5, 7, 8, 10, 14, 15, 16, 22, 25, 26, 29, 32, 33, 34, 35]). Important volume inequalities for the polars of projection bodies are the Petty projection inequality [23] and the Zhang projection inequality [31]: Among bodies of given volume the polar projection bodies have maximal volume precisely for ellipsoids and minimal volume precisely for simplices. The corresponding results for the volume of the projection body itself are major open problems in convex geometry (see [20]).

Mixed projection bodies in $\mathbb{R}^n$ were introduced in the classic volume of Bonnesen-Fenchel [4]. They are related to ordinary projection bodies in the same way that mixed volumes are related to ordinary volumes. In [17] and [18] Lutwak considered the volume of mixed projection bodies and their polars and established analogs of the classical mixed volume inequalities. More inequalities for polars mixed projection bodies were obtained by Leng et al. [14].

The theory of real convex bodies goes back to ancient times and continues to be a very active field now. Until recently the situation with complex convex bodies began to attract attention (see [1, 2, 9, 11, 12, 13, 24, 34, 36, 37]).

The real vector space $\mathbb{R}^n$ of real dimension $n$ is replaced by a complex vector space $\mathbb{C}^n$ of dimension $n$. We denote by $\| \cdot \|_K$ the norm corresponding to the
complex convex body $K \in \mathbb{C}^n$:

$$K = \{ z \in \mathbb{C}^n : \| z \|_K \leq 1 \}.$$  

In order to define volume, we identify $\mathbb{C}^n$ with $\mathbb{R}^{2n}$ using the standard mapping $\xi = (\xi_1, \ldots, \xi_n) = (\xi_{11} + i\xi_{12}, \ldots, \xi_{n1} + i\xi_{n2}) \mapsto (\xi_{11}, \xi_{12}, \ldots, \xi_{n1}, \xi_{n2})$.

The results can be stated as follows.

Let $K_1, \ldots, K_{2n-1}$ be convex bodies in $\mathbb{C}^n$ and $C \subset \mathbb{C}$ be a convex subset. The mixed complex projection body $\Pi^C(K_1, \ldots, K_{2n-1})$ is the convex body whose support function is defined by (see [2])

$$h(\Pi^C(K_1, \ldots, K_{2n-1}), w) = \frac{1}{2n} \int_{S^{2n-1}} h(C \cdot w, \xi)dS(K_1, \ldots, K_{2n-1}, \xi),$$

where $C \cdot w := \{cw \mid c \in C\}$ and $w \in \mathbb{C}^n$.

If $C = \{c\}(c \in \mathbb{C})$ is just a point, then $\Pi^C(K_1, \ldots, K_{2n-1}) = \{0\}$. Indeed, for every $w \in \mathbb{C}^n$,

$$h(\Pi^C(K_1, \ldots, K_{2n-1}), w) = \frac{1}{2n} \int_{S^{2n-1}} h(cw, \xi)dS(K_1, \ldots, K_{2n-1}, \xi)$$

$$= \frac{1}{2n} \int_{S^{2n-1}} cw \cdot \xi dS(K_1, \ldots, K_{2n-1}, \xi)$$

$$= \frac{1}{2n} cw \cdot \int_{S^{2n-1}} \xi dS(K_1, \ldots, K_{2n-1}, \xi)$$

$$= 0,$$

since the centroid of the mixed surface area measure is the origin (see [6]). Thus, $\Pi^C(K_1, \ldots, K_{2n-1}) = \{0\}$. Throughout this article, we assume that $C$ is not a point.

If $K_1 = \cdots = K_{2n-i-1} = K$ and $M = (K_{2n-i}, \ldots, K_{2n-1})$, then the mixed projection body $\Pi^C(K, \ldots, K, M_{2n-i}, \ldots, M_{2n-1})$ is written as $\Pi^C_i(K, M)$. In particular, we write $\Pi^C_i(K, L)$ for the mixed complex projection body $\Pi^C(K, \ldots, K, L, \ldots, L)$ with $i$ copies of $L$ and $2n - i - 1$ copies of $K$. For the mixed complex projection body $\Pi^C_i(K, B)$, we simply write $\Pi^C_i K$. The mixed complex projection body $\Pi^C_i K$ is written as $\Pi^C K$.

Recently, Abardia and Bernig [2] established the general Minkowski inequality, Aleksandrov-Fenchel inequality and Brunn-Minkowski inequality for mixed complex projection bodies. The results can be stated as follows.

**Theorem A** ([2]). If $K$ and $L$ are convex bodies in $\mathbb{C}^n$ and $C \subset \mathbb{C}$ is a convex subset, then

$$V(\Pi^C_i(K, L))^{2n-1} \geq V(\Pi^C K)^{2n-2}V(\Pi^C L),$$

with equality if and only if $K$ and $L$ are homothetic.
Theorem B ([2]). If \( K_1, \ldots, K_{2n-1} \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is a convex subset, while \( 2 \leq k \leq 2n-2 \), then
\[
V(\Pi^C(K_1, \ldots, K_{2n-1}))^k \geq \prod_{j=1}^{k} V(\Pi^C(K_j, \ldots, K_j, K_{k+1}, \ldots, K_{2n-1})).
\]

Theorem C ([2]). If \( K \) and \( L \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is a convex subset, then
\[
V(\Pi^C(K + L))^{\frac{1}{2n-1}} \geq V(\Pi^C K)^{\frac{1}{2n-1}} + V(\Pi^C L)^{\frac{1}{2n-1}},
\]
with equality if and only if \( K \) and \( L \) are homothetic.

The main purpose of this article is to establish polar forms of the above three inequalities.

Theorem 1.1. If \( K \) and \( L \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric convex subset, then
\[
(1.4) \quad V(\Pi^{C^*}(K, L))^{2n-1} \leq V(\Pi^{C^*} K)^{2n-2}V(\Pi^{C^*} L),
\]
with equality if and only if \( K \) and \( L \) are homothetic.

Theorem 1.2. If \( K_1, \ldots, K_{2n-1} \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric convex subset, while \( 2 \leq k \leq 2n-2 \), then
\[
(1.5) \quad V(\Pi^{C^*}(K_1, \ldots, K_{2n-1}))^k \leq \prod_{j=1}^{k} V(\Pi^{C^*}(K_j, \ldots, K_j, K_{k+1}, \ldots, K_{2n-1})).
\]

Theorem 1.3. If \( K \) and \( L \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric convex subset, then
\[
(1.6) \quad V(\Pi^{C^*}(K + L))^{-\frac{1}{2n-1}} \geq V(\Pi^{C^*} K)^{-\frac{1}{2n-1}} + V(\Pi^{C^*} L)^{-\frac{1}{2n-1}},
\]
with equality if and only if \( K \) and \( L \) are homothetic.

Please see the next section for the above interrelated notations, definitions and their background materials.

2. Notations and background material

In this section some notations and basic facts about convex bodies are presented. For general references the reader may wish to consult the books of Gardner [7] and Schneider [26].

For \( x, y \in \mathbb{R}^n \), we denote their scalar product by \( x \cdot y \). Similarly, for \( x, y \in \mathbb{C}^n \), we denote their complex scalar product by \( x \cdot y \). Let \( K^n \) denote the space of non-empty compact convex bodies in real vector space \( \mathbb{R}^n \) with the Hausdorff topology. A compact, convex set \( K \in K^n \) is uniquely determined by its support function \( h(K, \cdot) \) on the unit sphere \( S^{n-1} \), defined by
\[
(2.1) \quad h(K, u) = \max\{x \cdot u : x \in K\}, \quad u \in S^{n-1},
\]
where \( x \cdot u \) denotes the scalar product \( x \) and \( u \).

A compact set \( K \in \mathbb{R}^n \) is called a star body if the origin is an interior point of \( K \), every straight line passing through the origin crosses the boundary of the set at exactly two points, and its radial function \( \rho(K, \cdot) \) defined by

\[
\rho(K, u) = \max\{\lambda : \lambda u \in K\}, \quad u \in S^{n-1}
\]

is positive and continuous on \( S^{n-1} \). Let \( S^n \) denote the space of the star bodies in real vector space \( \mathbb{R}^n \).

We recall that the polar coordinate formula for volume in \( \mathbb{R}^n \) is

\[
V(K) = \frac{1}{n} \int_{S^{n-1}} \rho(K, u)^n dS(u),
\]

where \( dS(u) \) denotes the spherical Lebesgue measure on \( S^{n-1} \).

If \( K \) is a convex body that contains the origin in its interior, the polar body of \( K \), \( K^* \), is defined by

\[
K^* := \{ x \in \mathbb{R}^n : x \cdot y \leq 1 \text{ for all } y \in K \}.
\]

From the definition of support function, for every convex body \( K \) that contains the origin in its interior and \( \lambda > 0 \), it follows that

\[
(K^*)^* = K \text{ and } (\lambda K)^* = \frac{1}{\lambda} K^*.
\]

In particular, if \( K \) is a convex body that contains the origin in its interior, then

\[
h(K^*, u) = \frac{1}{\rho(K, u)} \text{ and } \rho(K^*, u) = \frac{1}{h(K, u)}, \quad u \in S^{n-1}.
\]

For \( K_1, K_2 \in \mathcal{K}^n \) and \( \lambda_1, \lambda_2 \geq 0 \), the Minkowski addition \( \lambda_1 K_1 + \lambda_2 K_2 \) is the convex body defined by

\[
h(\lambda_1 K_1 + \lambda_2 K_2, \cdot) = \lambda_1 h(K_1, \cdot) + \lambda_2 h(K_2, \cdot).
\]

If \( K_i \in \mathcal{K}^n(i = 1, 2, \ldots, k) \) and \( \lambda_i(i = 1, 2, \ldots, k) \) are nonnegative real numbers, then the volume of \( \lambda_1 K_1 + \cdots + \lambda_k K_k \) is a homogeneous polynomial of degree \( n \) in \( \lambda_i \) given by

\[
V(\lambda_1 K_1 + \cdots + \lambda_k K_k) = \sum_{i_1, \ldots, i_n} V(K_{i_1}, \ldots, K_{i_n}) \lambda_{i_1} \cdots \lambda_{i_n},
\]

where the sum is taken over all \( n \)-tuples \((i_1, \ldots, i_n)\) of positive integers not exceeding \( m \). The coefficient \( V(K_{i_1}, \ldots, K_{i_n}) \) is called the mixed volume of \( K_{i_1}, \ldots, K_{i_n} \). And it is nonnegative, symmetric in its arguments and monotone (with respect to set inclusion in each component). In particular, \( V(K, \ldots, K) = V(K) \). Let \( K_1 = \cdots = K_{n-i} = K \) and \( K_{n-i+1} = \cdots = K_n = L \), the mixed volume \( V(K_1, \ldots, K_n) \) is usually written as \( V_i(K, L) \). If \( L = B \), \( V_i(K, B) \) is the \( i \)-th Quermassintegral of \( K \) and is written as \( W_i(K) \). For \( 0 \leq i \leq n-1 \), we write \( W_i(K, L) \) for the mixed volume \( V(K_1, \ldots, K_n, B, \ldots, B, L) \).
ON POLARS OF MIXED COMPLEX PROJECTION BODIES

The mixed volume $V(K_1, \ldots, K_n)$ has the following integral representation:

$$(2.6) \quad V(K_1, \ldots, K_n) = \frac{1}{n} \int_{S^{n-1}} h(K_n, u) dS(K_1, \ldots, K_{n-1}, u),$$

where $S(K_1, \ldots, K_{n-1}, u)$ denotes the mixed surface area measure.

One of the most general and fundamental inequalities for mixed volumes is the Aleksandrov-Fenchel inequality: If $K_1, \ldots, K_n \in \mathcal{K}^n$ and $1 \leq k \leq n$, then

$$(2.7) \quad V(K_1, \ldots, K_n)^k \geq \prod_{j=1}^{k} V(K_{j_1}, \ldots, K_{j_k}, K_{k+1}, \ldots, K_n).$$

Unfortunately, the equality conditions of this inequality are, in general, unknown.

An important special case of inequality (2.7), where the equality conditions are known, is the classical inequality between the quermassintegrals (see [18]): If $K, L \in \mathcal{K}^n$ and $0 \leq i < j < n$, then

$$(2.8) \quad \omega_n^{j-i} W_i(K)^{n-j} \leq W_j(K)^{n-i},$$

with equality if and only if $K$ is a ball.

The Minkowski inequality for mixed volumes states as follows (see [19]): If $K, L \in \mathcal{K}^n$ and $0 \leq i \leq n-2$, then

$$(2.9) \quad W_i(K, L)^{n-1} \geq W_i(K)^{n-1} W_i(L),$$

with equality if and only if $K$ and $L$ are homothetic.

A consequence of the Minkowski inequality is the following Brunn-Minkowski inequality: If $K, L \in \mathcal{K}^n$ and $0 \leq i \leq n-2$, then

$$(2.10) \quad W_i(K + L)^{n-i} \geq W_i(K)^{n-i} + W_i(L)^{n-i},$$

with equality if and only if $K$ and $L$ are homothetic.

A generalization of inequality (2.10) is also known (but without equality conditions): If $K, L, K_1, \ldots, K_i \in \mathcal{K}^n$, $0 \leq i \leq n-2$, and $M = (K_1, \ldots, K_i)$, then

$$(2.11) \quad V_i(K + L, M)^{n-i} \geq V_i(K, M)^{n-i} + V_i(L, M)^{n-i}.$$  

The dual mixed volume $\tilde{V}_{-1}(K, L)$ of $K, L \in S^n$ was defined by (see [21])

$$(2.12) \quad \tilde{V}_{-1}(K, L) = \frac{1}{n} \int_{S^{n-1}} \rho(K, u)^{n+1} \rho(L, u)^{-1} dS(u).$$

It is easy to check that

$$(2.13) \quad \tilde{V}_{-1}(K, K) = V(K).$$

The following Minkowski inequality for dual mixed volume $\tilde{V}_{-1}(K, L)$ will play an important role in our proof (see [21]). If $K, L \in S^n$, then

$$(2.14) \quad \tilde{V}_{-1}(K, L)^n \geq V(K)^{n+1} V(L)^{-1},$$

with equality if and only if $K$ and $L$ are dilates.
Let $K_1, \ldots, K_{2n-1}$ be convex bodies in $\mathbb{C}^n$. If $C$ is an origin symmetric convex subset in $\mathbb{C}$, then the mixed complex projection body $\Pi^C(K_1, \ldots, K_{2n-1})$ is origin symmetric. Note that origin symmetric complex convex bodies in $\mathbb{C}^n$ correspond to those origin symmetric convex bodies $K$ in $\mathbb{R}^{2n}$ that are invariant with respect to any coordinate-wise two-dimensional rotation, namely for each $\theta \in [0, 2\pi]$ and each $\xi = (\xi_{11}, \xi_{12}, \ldots, \xi_{n1}, \xi_{n2}) \in \mathbb{R}^{2n}$,
\[
\|\xi\|_K = \|R_\theta(\xi_{11}, \xi_{12}), \ldots, R_\theta(\xi_{n1}, \xi_{n2})\|_K,
\]
where $R_\theta$ stands for the counterclockwise rotation of $\mathbb{R}^2$ by the angle $\theta$ with respect to the origin.

We use $\Pi^{C^*}(K_1, \ldots, K_{2n-1})$ to denote the polar body of $\Pi^C(K_1, \ldots, K_{2n-1})$, and call it a polar of mixed complex projection body $K_i (i = 1, \ldots, 2n-1)$. We will simply write $\Pi^{C^*}K$ and $\Pi^{C^*}(K, L)$ rather than $(\Pi^C)^*K$ and $(\Pi^C)^*(K, L)$, respectively.

Let $\mathcal{C}(S^{n-1})$ be the spaces of continuous functions on $S^{n-1}$ with uniform topology and let $\mathcal{M}(S^{n-1})$ denote the dual space of signed finite Borel measures with weak* topology. The convolution $\mu * f \in \mathcal{C}(S^{n-1})$ of a measure $\mu \in \mathcal{M}(S^{n-1})$ and a function $f \in \mathcal{C}(S^{n-1})$ is defined by:
\[
(\mu * f)(u) = \int_{S^{n-1}} f(u) d\mu(\cdot).
\]

The canonical pairing of $f \in \mathcal{C}(S^{n-1})$ and $\mu \in \mathcal{M}(S^{n-1})$ is defined by:
\[
\langle \mu, f \rangle = \langle f, \mu \rangle = \int_{S^{n-1}} f(u) d\mu(u).
\]

The following property of spherical convolution will be very useful (see [28]):

If $\mu, \nu \in \mathcal{M}(S^{n-1})$ and $f \in \mathcal{C}(S^{n-1})$, then
\[
(\mu * \nu, f) = \langle \mu, f * \nu \rangle.
\]

3. Main results

Lemma 3.1 ([2]). If $K_1, \ldots, K_{2n-1}, L_1, \ldots, L_{2n-1}$ are convex bodies in $\mathbb{C}^n$ and $C \subset \mathbb{C}$ is a convex subset, then
\[
V(K_1, \ldots, K_{2n-1}, \Pi^C(L_1, \ldots, L_{2n-1})) = V(L_1, \ldots, L_{2n-1}, \Pi^{C^*}(K_1, \ldots, K_{2n-1})),
\]
where $\overline{C}$ is the complex conjugate of $C$.

Note that $h(C \cdot \cdot, \xi) = h(C \cdot, \xi \cdot)$ and the surface area measure $S(B, \cdot)$ is constant in $S^{2n-1}$, we have the following lemma.

Lemma 3.2 ([30]). If $C \subset \mathbb{C}$ is a convex subset, then
\[
\Pi^C(B, \ldots, B) = \Pi^{C^*}(B, \ldots, B) = r_C B,
\]
where $r_C$ is a constant which depends only on $C$. 

Combining the special case $K_1 = \cdots = K_{2n-1} = B$ of Lemmas 3.1 and 3.2 to get:

**Lemma 3.3.** If $L_1, \ldots, L_{2n-1}$ are convex bodies in $\mathbb{C}^n$ and $C \subset \mathbb{C}$ is a convex subset, then

$$W_{2n-1}(\Pi^C(L_1, \ldots, L_{2n-1})) = r_C V(L_1, \ldots, L_{2n-1}, B).$$

For $L_1 = \cdots = L_{2n-2} = K$ and $L_{2n-1} = L$, identity (3.1) becomes

$$W_{2n-1}(\Pi^C_1(K, L)) = r_C W_1(K, L).$$

For $L_1 = \cdots = L_{2n-i-1} = L$ and $L_{2n-i} = \cdots = L_{2n-1} = B$, identity (3.1) becomes,

$$W_{2n-1}(\Pi^C_i L) = r_C W_{i+1}(L).$$

In [24], Schuster introduced the operator $M_\delta : S^n \to \mathcal{K}^n$ which was defined by

$$h(M_\delta L, u) = \rho^{n+1}(L, \cdot) \ast h(F, \cdot), \ u \in S^{n-1}.$$\[Here \(h(F, \cdot)\) is the generating function of \(\Phi\), where \(F \in \mathbb{R}^n\) is a figure of revolution which is not a singleton and depends on \(u\).]

In particular, for the classical projection body operator $\Pi : \mathcal{K}^n \to \mathcal{K}^n$, the operator $M_\Pi : S^n \to \mathcal{K}^n$ is defined by

$$h(M_\Pi L, u) = \rho^{n+1}(K, \cdot) \ast h([\frac{-1}{2}, \frac{1}{2}], u, \cdot), \ u \in S^{n-1},$$

where $F = [-\frac{1}{2}, \frac{1}{2}] \cdot u = [-\frac{1}{2}, \frac{1}{2}]$.

This operator can be extended to complex case. Let $L$ be a star body in $\mathbb{C}^n$ and $C$ be an origin symmetric convex set in $\mathbb{C}$. Then the operator $M_{\Pi^C}$ can be defined by

$$h(M_{\Pi^C} L, \xi) = \rho^{2n+1}(L, \cdot) \ast h(C \cdot \xi, \cdot), \ \xi \in \mathbb{C}^n,$$

where $F = C \cdot \xi$.

**Lemma 3.4.** Let $K_1, \ldots, K_{2n-1}$ be convex bodies and $L$ be a star body in $\mathbb{C}^n$. If $C$ is an origin symmetric convex set in $\mathbb{C}$, then

$$\tilde{V}_{2n-1}(L, \Pi^C(K_1, \ldots, K_{2n-1})) = V(K_1, \ldots, K_{2n-1}, M_{\Pi^C}L).$$

**Proof.** By (2.12), (2.5), (1.3), (3.4), (2.17) and (2.6), we have

$$\tilde{V}_{2n-1}(L, \Pi^C(K_1, \ldots, K_{2n-1}))$$

$$= \frac{1}{2n} \int_{S_{2n-1}} \rho(L, \xi)^{2n+1} \rho(\Pi^C(K_1, \ldots, K_{2n-1}), \xi)^{-1} d\xi$$

$$= \frac{1}{2n} \int_{S_{2n-1}} \rho(L, \xi)^{2n+1} h(\Pi(C \cdot \xi, \cdot) \ast S(K_1, \ldots, K_{2n-1}, \cdot))$$

$$= \frac{1}{(2n)^2} \rho(L, \xi)^{2n+1} h(C \cdot \xi, \cdot) \ast S(K_1, \ldots, K_{2n-1}, \cdot).$$
\[
\begin{align*}
&= \frac{1}{(2n)^2} \langle \rho(L, \cdot)^{2n+1} \ast h(\mathcal{C} \cdot \omega, \cdot), S(K_1, \ldots, K_{2n-1}, \omega) \rangle \\
&= \frac{1}{2n} \langle h(M_{\Pi \mathcal{C}_L}, \omega), S(K_1, \ldots, K_{2n-1}, \omega) \rangle \\
&= \frac{1}{2n} \int_{S^{2n-1}} h(M_{\Pi \mathcal{C}_L}, \omega) dS(K_1, \ldots, K_{2n-1}, \omega) \\
&= V(K_1, \ldots, K_{2n-1}, M_{\Pi \mathcal{C}_L}). 
\end{align*}
\]

If \( K_1 = \cdots = K_{2n-1} = K \) and \( K_{2n-i} = \cdots = K_{2n-1} = B \), then Lemma 3.4 reduces to:

**Lemma 3.5.** Let \( K \) be a convex body and \( L \) be a star body in \( \mathbb{C}^n \). If \( C \) is an origin symmetric convex set in \( \mathbb{C} \), then

\[
\tilde{V}_{-1}(L, \Pi_{\mathcal{C}}^* K) = W_i(K, M_{\Pi \mathcal{C}_L}).
\]

**Proof of Theorem 1.1.** Suppose \( Q \) is a star body in \( \mathbb{C}^n \), from Lemma 3.4 and the Aleksandrov-Fenchel inequality (2.7) and the Minkowski inequality (2.14), it follows that

\[
\begin{align*}
&\tilde{V}_{-1}(Q, \Pi_{\mathcal{C}}^*(K, L))^{2n-1} \\
&\geq V_i(K, M_{\Pi \mathcal{C}_Q})^{2n-2} V_1(L, M_{\Pi \mathcal{C}_Q}) \\
&= \tilde{V}_{-1}(Q, \Pi^* C K)^{2n-2} \tilde{V}_{-1}(Q, \Pi^* C L) \\
&\geq V(Q)^{\frac{(2n-1)(2n+1)}{2n}} V(\Pi^* C K)^{-\frac{2n-2}{2n}} V(\Pi^* C L)^{-\frac{1}{2n}}.
\end{align*}
\]

By the equality conditions of (2.14), equality in (3.5) holds if and only if \( Q, \Pi^* C K, \) and \( \Pi^* C L \) are dilates.

Set \( Q = \Pi_{\mathcal{C}}^*(K, L) \) and note that \( \tilde{V}_{-1}(Q, Q) = V(Q) \) to obtain the desired inequality (1.4). If there is equality in (1.4), then there exist \( \lambda_1, \lambda_2 > 0 \) such that

\[
(3.6) \quad \Pi_{\mathcal{C}}^*(K, L) = \lambda_1 \Pi^* C K = \lambda_2 \Pi^* C L.
\]

From equality in (1.4), it follows that

\[
(3.7) \quad \lambda_1^{2n-2} \lambda_2 = 1.
\]

On the other hand, from the definition of the polar body, (3.6) is equivalent to

\[
(3.8) \quad \Pi_{\mathcal{C}}^*(K, L) = \frac{1}{\lambda_1} \Pi^* C K = \frac{1}{\lambda_2} \Pi^* C L.
\]

Moreover, (3.2), (3.3) and (3.8) imply

\[
(3.9) \quad \lambda_1 = \frac{W_1(K)}{W_1(K, L)} \quad \text{and} \quad \lambda_2 = \frac{W_1(L)}{W_1(K, L)}.
\]
Hence, by (3.7) and (3.9) we have
\[ W_1(K, L)^{2n-1} = W_1(K)^{2n-2} W_1(L), \]
which implies, by (2.9), that \( K \) and \( L \) are homothetic. \( \square \)

**Remark 1.** The real case of Theorem 1.1 was given by Zhao and Leng [35]. The real case of Theorem 1.1 for the polar Blaschke-Minkowski homomorphisms was given by Schuster [27].

**Proof of Theorem 1.2.** Suppose \( Q \) is a star body in \( \mathbb{C}^n \), from Lemma 3.4 and the Aleksandrov-Fenchel inequality (2.7), we have that
\[
\tilde{V}_{-1}(Q, \Pi^{C^*}(K_1, \ldots, K_{2n-1}))^k = V(K_1, \ldots, K_{2n-1}, M_{\Pi^{C^*}Q})^k \\
\geq \prod_{j=1}^{k} V(K_j, \ldots, K_{k+1}, \ldots, K_{2n-1}, M_{\Pi^{C^*}Q}) \\
= \prod_{j=1}^{k} \tilde{V}_{-1}(Q, \Pi^{C^*}(K_j, \ldots, K_{k+1}, \ldots, K_{2n-1})).
\]
Write \( \Pi_k^{C^*}(K_j, N) \) for the mixed operator \( \Pi^{C^*}(K_j, \ldots, K_j, K_{k+1}, \ldots, K_{2n-1}) \), where \( k = 2n - k - 1 \). Then by inequality (2.14), we have
\[
\tilde{V}_{-1}(Q, \Pi_k^{C^*}(K_j, N))^{2n} \geq V(Q)^{2n+1} V(\Pi_k^{C^*}(K_j, N))^{-1}.
\]
Hence, we obtain
\[
(3.10) \quad \tilde{V}_{-1}(Q, \Pi^{C^*}(K_1, \ldots, K_{2n-1}))^{2nk} \geq V(Q)^{(2n+1)k} \prod_{j=1}^{k} V(\Pi_k^{C^*}(K_j, N))^{-1}.
\]
Setting \( Q = \Pi^{C^*}(K_1, \ldots, K_{2n-1}) \) in (3.10), it becomes the desired inequality. \( \square \)

**Remark 2.** The real case of Theorem 1.2 was given by Zhao and Leng [35]. The real case of Theorem 1.2 for the polar Blaschke-Minkowski homomorphisms was given by Schuster [27].

Combine the special case \( k = 2n - 2 \) of Theorem 1.2 and Theorem 1.1 to obtain:

**Corollary 3.6.** If \( K_1, \ldots, K_{2n-1} \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric convex subset in \( \mathbb{C} \), then
\[
V(\Pi^{C^*}(K_1, \ldots, K_{2n-1}))^{2n-1} \leq V(\Pi^{C^*}K_1 \cdots V(\Pi^{C^*}K_{2n-1}),
\]
with equality if and only if the \( K_j \) are homothetic.
The special case \( K_1 = \cdots = K_{2n-j-1} = K \) and \( K_{2n-j} = \cdots = K_{2n-1} = L \) of Corollary 3.6 leads to a generalization of Theorem 1.1:

**Corollary 3.7.** If \( K \) and \( L \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric convex subset in \( \mathbb{C} \), while \( 1 \leq j \leq 2n-2 \), then

\[
V(\Pi_j^{C^*}(K, L))^{2n-1} \leq V(\Pi_j^{C^*}K)^{2n-j-1}V(\Pi_j^{C^*}L)^{j},
\]

with equality if and only if \( K \) and \( L \) are homothetic.

An important consequence of Corollary 3.7 states as follows.

**Theorem 3.8.** Let \( K, L \) be convex bodies in \( \mathbb{C}^n \) and \( M \subset \mathbb{C}^n \) be a subset which contains \( K \) and \( L \). Suppose \( C \subset \mathbb{C} \) is a convex subset and \( 1 \leq j \leq 2n-2 \). If either

\[
V(\Pi_j^{C^*}(K, Q)) = V(\Pi_j^{C^*}(L, Q)) \quad \text{for all} \quad Q \in M,
\]

or

\[
V(\Pi_j^{C^*}(Q, K)) = V(\Pi_j^{C^*}(Q, L)) \quad \text{for all} \quad Q \in M,
\]

hold, then it follows that \( K = L \), up to translation.

**Proof.** Suppose (3.11) holds. Take \( K \) for \( Q \) in (3.11), use Corollary 3.7 to get

\[
V(\Pi_j^{C^*}K) \leq V(\Pi_j^{C^*}L),
\]

with equality if and only if \( K \) and \( L \) are homothetic.

Take \( L \) for \( Q \) in (3.11), use Corollary 3.7 to get

\[
V(\Pi_j^{C^*}K) \geq V(\Pi_j^{C^*}L).
\]

Hence, there is equality in (3.13) and thus, there is a \( \lambda > 0 \) for which \( K \) and \( \lambda L \) are translates. Note that the complex projection body operator \( \Pi_j^C \) is homogeneous of degree \( 2n - 1 \). But equality in (3.13) implies that \( \lambda = 1 \).

Exactly the same sort of argument shows that condition (3.12) implies that \( K \) and \( L \) must be translates. \( \square \)

**Remark 3.** The real case of Theorem 3.8 was given by Zhao and Leng [35].

In fact a considerably more general inequality of Brunn-Minkowski inequality for polars of mixed complex projection bodies holds:

**Theorem 3.9.** If \( K \) and \( L \) are convex bodies in \( \mathbb{C}^n \) and \( C \subset \mathbb{C} \) is an origin symmetric complex convex subset, while \( 0 \leq j \leq 2n-2 \), then

\[
V(\Pi_j^{C^*}(K + L))^{-\frac{1}{2n(2n-j-1)}} \leq V(\Pi_j^{C^*}K)^{-\frac{1}{2n(2n-j-1)}} + V(\Pi_j^{C^*}L)^{-\frac{1}{2n(2n-j-1)}},
\]

with equality if and only if \( K \) and \( L \) are homothetic.
Proof. Suppose $Q$ is a star body in $C^n$, from Lemma 3.5, (2.11) and (2.14), we have
\[
\tilde{V}_{-1}(Q, \Pi_j^{C^*} (K + L))^{\frac{1}{n-j}} \geq W_j(K, M_{\Pi_j} Q)^{\frac{1}{n-j}} + W_j(L, M_{\Pi_j} Q)^{\frac{1}{n-j}} \geq V(Q)^{\frac{1}{n-j}} [V(\Pi_j^{C^*} K)^{\frac{1}{n-j}} + V(\Pi_j^{C^*} L)^{\frac{1}{n-j}}].
\] (3.15)

By the equality conditions of (2.14), equality in (3.15) holds if and only if $Q, \Pi_j^{C^*} K$ and $\Pi_j^{C^*} L$ are delates.

Set $Q = \Pi_j^{C^*} (K + L)$ and note that $\tilde{V}_{-1}(Q, Q) = V(Q)$ to obtain the desired inequality (3.14). If there is equality in (3.14), then there exist $\lambda_1, \lambda_2 > 0$ such that
\[
\Pi_j^{C^*} (K + L) = \lambda_1 \Pi_j^{C^*} K = \lambda_2 \Pi_j^{C^*} L.
\] (3.16)

From equality in (3.14), it follows that
\[
\lambda_1^{\frac{1}{n-j}} + \lambda_2^{\frac{1}{n-j}} = 1. \tag{3.17}
\]

On the other hand, from the definition of polar body, (3.16) is equivalent to
\[
\Pi_j^{C^*} (K + L) = \frac{1}{\lambda_1} \Pi_j^{C^*} K = \frac{1}{\lambda_2} \Pi_j^{C^*} L. \tag{3.18}
\]

Moreover, (3.3) and (3.18) imply
\[
\lambda_1 = \frac{W_{j+1}(K)}{W_{j+1}(K, L)} \quad \text{and} \quad \lambda_2 = \frac{W_{j+1}(L)}{W_{j+1}(K, L)}. \tag{3.19}
\]

Hence, by (3.17) and (3.19) we have
\[
W_{j+1}(K + L)^{\frac{1}{n-j}} = W_{j+1}(K)^{\frac{1}{n-j}} + W_{j+1}(L)^{\frac{1}{n-j}},
\]
which implies, by (2.10), that $K$ and $L$ are homothetic. $\square$

Remark 4. The case $j = 0$ of Theorem 3.9 is just Theorem 1.3. The real case of Theorem 1.3 was given by Schuster [27].
