THE JACOBI SUMS OVER GALOIS RINGS
AND ITS ABSOLUTE VALUES

YOUNG HO JANG

Abstract. The Galois ring $R$ of characteristic $p^n$ having $p^{mn}$ elements is a finite extension of the ring of integers modulo $p^n$, where $p$ is a prime number and $n, m$ are positive integers. In this paper, we develop the concepts of Jacobi sums over $R$ and under the assumption that the generating additive character of $R$ is trivial on maximal ideal of $R$, we obtain the basic relationship between Gauss sums and Jacobi sums, which allows us to determine the absolute value of the Jacobi sums.

1. Introduction

Throughout this paper, $p$ will denote a fixed prime number and $n, m$ positive integers. We set $q = p^m$. Let $\mathbb{Z}$, $\mathbb{C}$, $\mathbb{C}^1$, $\pi$, $\mathbb{F}_q$, $\mathbb{Z}_{p^n}$ and $GR(p^n, m)$ be the ring of integers, the field of complex numbers, the unit circle in the complex plane, the complex conjugate of $a \in \mathbb{C}$, the finite field of order $q$, the ring of integers modulo $p^n$ and the Galois ring of characteristic $p^n$ having $q^n$ elements, respectively.

Jacobi sums over finite fields and finite rings were introduced and studied by many mathematicians. For the detailed story and relative references see [1, 3, 7]. In particular, in [11, 12] Wang studied a general theory of Jacobi sums over residue class rings and finite commutative rings with identity. In [4], Ishibashi defined the Gauss sums and Jacobi sums over $GR(2^2, m)$ to find relations between the irreducible modules of the Terwilliger algebra and the Jacobi sums over the local ring. In [6], Jin et al. provided explicit description on the Gauss sums and Jacobi sums over $GR(p^2, m)$, and showed that the values of these sums can be reduced to the Gauss sums and Jacobi sums over $\mathbb{F}_q$ for all non-trivial cases. Also, in [5], Jang and Jun studied the Gauss sums over $GR(p^n, m)$ under the assumption that the generating additive character of $GR(p^n, m)$ is trivial on maximal ideal of $GR(p^n, m)$. As a follow-up to the previous work [5], we continue that line of research in this paper. The purpose of this paper is to develop the concepts of Jacobi sums over $GR(p^n, m)$ and
under the assumption that the generating additive character of \( GR(p^n, m) \) is trivial on maximal ideal of \( GR(p^n, m) \), we obtain the basic relationship between Gauss sums and Jacobi sums, which allows us to determine the absolute value of the Jacobi sums. Many of our results are exact analogues of those holding over \( \mathbb{F}_q \). However, their proofs are complicated by the change in significance of the elements, which may be zero divisors in \( GR(p^n, m) \).

We conclude this section by recalling some basic properties of the Galois ring \( R = GR(p^n, m) \). These have been well documented in [8, 10]. \( R \) is a local ring having unique maximal ideal \( M = pR \) and \( |M| = q^{n-1} \). The group of units \( R^* \) of \( R \) contains a unique cyclic group of order \( q-1 \) (see [8, Theorem XVI.9]). If \( \xi \) is a generator of this group, then, by [8, Theorem XVIII.2], \( R^* = \mathcal{T}^* \times (1 + M) \) where \( \mathcal{T}^* = \langle \xi \rangle \) is the cyclic group of order \( q-1 \) and \( 1 + M \) is the multiplicative \( p \)-group of order \( q^{n-1} \). The set \( \mathcal{T} = \{0\} \cup \mathcal{T}^* = \{0, 1, \xi, \ldots, \xi^{q-2}\} \) is called the Teichmüller set of \( R \). Every element \( z \in R \) has a unique \( p \)-adic representation:

\[
(1) \quad z = z_0 + z_1 p + \cdots + z_{n-1} p^{n-1}, \quad \text{where } z_i \in \mathcal{T} \text{ for } 0 \leq i \leq n-1.
\]

Moreover, \( z \in R^* \) if and only if \( z_0 \neq 0 \) and \( z \in M \) if and only if \( z_0 = 0 \). Any element of \( R \setminus \{0\} \) is either a unit or a zero divisor. Since the zero divisors in \( R \) are those elements divisible by \( p \), any element \( z \in R \setminus \{0\} \) can be written as

\[
(2) \quad z = p^k u, \quad u \in R^*, \quad 0 \leq k \leq n-1.
\]

For any Galois ring \( R \) the trace mapping \( \text{Tr} : R \to \mathbb{F}_{p^n} \) is defined by

\[
(3) \quad \text{Tr} \left( \sum_{i=0}^{n-1} z_i p^i \right) = \sum_{i=0}^{n-1} (z_i + z_i p + \cdots + z_i p^{n-1}) p^i.
\]

\( \text{Tr} \) is an epimorphism of \( \mathbb{F}_{p^n} \)-modules and \( \text{Tr} \) can be reduced by the mod-\( p \) reduction map to the trace mapping \( \text{tr} : \mathbb{F}_q \to \mathbb{F}_p \) of finite fields.

2. Characters of Galois rings and Gauss sums over Galois rings

An additive character of \( R \) is a homomorphism from the additive group of \( R \) to \( \mathbb{C}^1 \). Using (3), for any \( x, y \in R \), the additive characters of \( R \) are given by

\[
(4) \quad \psi_x(y) = e^{2\pi i \text{Tr}(xy)/p^n},
\]

different \( x \)'s affording different additive characters. In fact, \( \{\psi_x\}_{x \in R} \) consists of all additive characters of \( R \) in [2, Lemma 6]. We see that \( \psi_0 \) is the trivial additive character of \( R \), \( \psi_x(y) = \psi_1(xy) \), \( \psi_x(?y) = \psi_x(-y) \) and \( \psi(= \psi_1) \) is called the generating additive character of \( R \). Let \( \hat{R}^* \) denote the group of additive characters on \( R \).

A multiplicative character \( \chi \) of \( R^* \) is a homomorphism from the multiplicative group \( R^* \) to \( \mathbb{C}^1 \). We see that \( \chi(1) = 1, \chi(x) \) is a \((q-1)q^{n-1}\)-th root of unity and \( \chi^{-1}(x) = \chi(x^{-1}) = \chi(x)^{-1} = \overline{\chi(x)} = \overline{x}(x) \). We extend \( \chi \) as the character of \( R \) by defining \( \chi(M) = 0 \). We call this the multiplicative character
of $R$. The trivial character $\chi_0$ of $R$ is defined by $\chi_0(R^*) = 1$. Let $\hat{R^*}$ denote the group of multiplicative characters on $R$.

**Remark 2.1.** In [9], the authors extend $\chi$ as the character of $R = GR(2^2, m)$ by defining $\chi(M) = 1$ for $\chi = \chi_0$ and $\chi(M) = 0$ for $\chi \neq \chi_0$; this is different from the definition we have given here.

**Remark 2.2.** Since $R^* = T^* \times (1 + M)$, we know that $\hat{R^*} = \hat{T^*} \times \hat{(1 + M)}$. In particular, the multiplicative characters $\chi$ of $R$ that vanish on $T^*$ (i.e., $\chi(\alpha) = 1$ for $\alpha \in T^*$) are in one-to-one correspondence with the multiplicative characters of $1 + M$. Particularly, for $R = GR(p^2, m)$, from the $p$-adic representation (1)

\[
z = z_0 + z_1 p \quad (z_0, z_1 \in T), \quad M = pT
\]

and

\[
(1 + M, \cdot) = (1 + pT, \cdot) \cong (\mathbb{F}_q, +), \quad 1 + px \mapsto \overline{x} = x \mod p \quad \text{for} \quad x \in T.
\]

Hence multiplicative characters $\chi \in \hat{R^*}$ that vanish on $T^*$ are given by

\[
\chi(1 + px) = \varphi_a(\overline{x}) \quad (x \in T, \quad a, \overline{x} \in \mathbb{F}_q),
\]

where $\varphi_a$ is an additive character of $\mathbb{F}_q$ defined by

\[
\varphi_a(\overline{x}) = e^{2\pi i \tr(a\overline{x})/p} \quad \text{for all} \quad a, \overline{x} \in \mathbb{F}_q.
\]

**Remark 2.3.** Let $G$ be a finite abelian group with identity element $1_G$ and $\hat{G}$ an abelian group of characters of $G$. It is well known in [7, Theorem 5.4] that if $f$ is a nontrivial character of $G$, then

\[
\sum_{g \in G} f(g) = 0.
\]

Denote by $\mathbb{C}^R$ the vector space over $\mathbb{C}$ of all functions from $R$ to $\mathbb{C}$. This is an inner product space with Hermitian inner product $\langle \cdot, \cdot \rangle$ defined for $f, g \in \mathbb{C}^R$ by

\[
\langle f, g \rangle = \sum_{x \in R} f(x) \overline{g(x)}.
\]

Then the set $\{\delta_x \mid x \in R\}$ of characteristic functions defined by

\[
\delta_x(y) = \begin{cases} 
1 & \text{if } x = y \\
0 & \text{if } x \neq y
\end{cases}
\]

forms an orthonormal basis for $\mathbb{C}^R$, with $\langle \delta_x, \delta_y \rangle = \delta_x(y)$. Hence $\mathbb{C}^R$ is a $q^n$-dimensional $\mathbb{C}$-vector space. Also, additive characters $\psi_x$ of $R$ defined by (4) are also orthogonal in this inner product space,

\[
\langle \psi_x, \psi_y \rangle = \sum_{s \in R} \psi_x(s) \overline{\psi_y(s)} = \sum_{s \in R} \psi_{x-y}(s) = \begin{cases} 
q^n & \text{if } x = y \\
0 & \text{if } x \neq y
\end{cases} \quad \text{(by (7))}
\]
and form an orthogonal basis for \( C^R \). Since \( \chi \in C^R \), hence \( \chi \) is a linear combination of the additive characters of \( R \). More precisely, for a nontrivial character \( \chi \in \hat{R} \), we have

\[
\chi = \frac{1}{q^n} \sum_{x \in \hat{R}} G(\chi, \psi_x) \overline{\psi_x},
\]

where

\[
G(\chi, \psi_x) := \langle \chi, \overline{\psi_x} \rangle = \sum_{y \in \hat{R}} \chi(y) \overline{\psi_x(y)} = \sum_{y \in \hat{R}} \chi(y) \psi(xy),
\]

which is called the Gauss sum over \( R \).

The elementary properties of Gauss sums over \( R \) in accordance with conditions of characters of \( R \) investigated in [5]. In particular, under the assumption that \( \psi \in \hat{R}^+ \) is trivial on \( M \), the authors computed the modulus of \( G(\chi, \psi_x) \).

The following two results have been proved in [5].

**Proposition 2.4** ([5, Lemma 3.1]). Let \( \chi \in \hat{R}^+ \) be a nontrivial character. Then

\[
1 (11) G(\chi, \psi_x) = \begin{cases} \chi(x)G(\chi, \psi) & \text{if } x \in \hat{R}, \\ 0 & \text{if } x \in M \text{ and } \psi \in \hat{R}^+ \text{ is trivial on } M. \end{cases}
\]

**Proposition 2.5** ([5, Theorem 3.3]). Let \( \chi \in \hat{R}^+ \) be a nontrivial character. If \( \psi \in \hat{R}^+ \) is trivial on \( M \), then

\[
(12) |G(\chi, \psi_x)|^2 = \begin{cases} q^n & \text{if } x \in \hat{R}, \\ 0 & \text{if } x \in M. \end{cases}
\]

**Proposition 2.6.** Let \( \chi \in \hat{R}^+ \) be a nontrivial character. If \( \psi \in \hat{R}^+ \) is trivial on \( M \), then

\[
(13) G(\chi, \psi)G(\overline{\chi}, \overline{\psi}) = \chi(-1)q^n.
\]

**Proof.** From (11) we have

\[
\sum_{x \in \hat{R}} G(\chi, \psi_x)G(\overline{\chi}, \psi_x) = \sum_{x \in \hat{R}} G(\chi, \psi_x)G(\overline{\chi}, \psi_x) = G(\chi, \psi)G(\overline{\chi}, \overline{\psi}) \sum_{x \in \hat{R}} 1
\]

\[
= (q - 1)q^n G(\chi, \psi)G(\overline{\chi}, \overline{\psi}).
\]

On the other hand, (10) yields that

\[
\sum_{x \in \hat{R}} G(\chi, \psi_x)G(\overline{\chi}, \psi_x) = \sum_{x \in \hat{R}} \sum_{y \in \hat{R}} \chi(y) \psi_x(y) \sum_{z \in \hat{R}} \overline{\psi_x(z)}
\]

\[
= \sum_{y \in \hat{R}} \sum_{z \in \hat{R}} \chi(y) \overline{\psi_x(y + z)}
\]

\[
= \chi(-1) \sum_{y \in \hat{R}} \sum_{z \in \hat{R}} 1 + \sum_{y \in \hat{R}} \chi(yz^{-1}) \sum_{x \in \hat{R}} \psi_x(y + z)
\]

\[
= \chi(-1)(q - 1)q^n \text{ (by (7))}.
\]
By comparing above two formulas we have (13).

□

Proposition 2.7. Let \( \chi \in \hat{R}^* \) be a nontrivial character. If \( \psi \in \hat{R}^* \) is trivial on \( M \), then

\[
\chi = \frac{1}{q^n} G(\chi, \psi) \sum_{x \in R^*} \chi(x^{-1})\overline{\psi_x}.
\]

Proof. From (9) and (11), it is obvious. □

3. Jacobi sums over Galois rings

Let \( \chi_1, \ldots, \chi_l \in \hat{R}^* \). For \( \alpha \in R \), a sum of the form

\[
J_{\alpha}(\chi_1, \ldots, \chi_l) = \sum_{s_1, \ldots, s_l \in R^* \atop s_1 + \cdots + s_l = \alpha} \chi_1(s_1) \cdots \chi_l(s_l)
\]

is called a Jacobi sum relative to \( \chi_1, \ldots, \chi_l \). If \( l-1 \) of the terms in \( s_1 + \cdots + s_l \) is chosen, the last term is uniquely determined by the requirement that whole sum equals \( \alpha \). Thus (15) contains \((q-1)q^{n-1}\) \( l-1 \) terms. It is easy to show that if \( \sigma \) is a permutation of \( \{1, \ldots, l\} \), then

\[ J_{\alpha}(\chi_{\sigma(1)}, \ldots, \chi_{\sigma(l)}) = J_{\alpha}(\chi_1, \ldots, \chi_l). \]

We drop the subscript \( \alpha \) from \( J_{\alpha} \) when \( \alpha = 1 \). Then

\[ J(\chi_1, \ldots, \chi_l) = \sum_{s_1, \ldots, s_l \in R^* \atop s_1 + \cdots + s_l = 1} \chi_1(s_1) \cdots \chi_l(s_l) \]

\[
\text{(16)}
\]

For \( \alpha \in R \setminus \{0\} \), let \( \alpha = p^k u \), \( 0 \leq k \leq n-1 \), \( u \in R^* \) as in (2). Then

\[ J_{p^k u}(\chi_1, \ldots, \chi_l) = \chi_1 \cdots \chi_l(u) J_{p^k}(\chi_1, \ldots, \chi_l) \]

and

\[ J_{u}(\chi_1, \ldots, \chi_l) = \chi_1 \cdots \chi_l(u) J_{1}(\chi_1, \ldots, \chi_l). \]

In particular, \( J_{1}(\chi_1) = \chi_1(1) = 1 \) and for \( l = 2 \), we have

\[
J(\chi_1, \chi_2) = \sum_{s_1, s_2 \in R^* \atop s_1 + s_2 = 1} \chi_1(s_1)\chi_2(s_2) = \chi_1\chi_2(-1) \sum_{s_1, s_2 \in R^* \atop s_1 + s_2 + 1 = 0} \chi_1(s_1)\chi_2(s_2)
\]

\[
\text{(17)}
\]

\[ = \sum_{x \in R^* \setminus (1+M)} \chi_1(x)\chi_2(1-x). \]

The following two theorems are proved in [13, Theorem 4] for \( GR(2^2, m) \) and in [6, Theorem 4.1] for \( GR(p^2, m) \); the proofs of the more general results follow along precisely the same lines.
Theorem 3.1. For $\chi_1, \chi_2 \in \hat{R}^*$,

$$J(\chi_1, \chi_2) = \begin{cases} (q - 2)q^{n-1} & \text{if } \chi_1 = \chi_2 = \chi_0, \\ 0 & \text{if } \chi_2 = \chi_0 \text{ and } \chi_1(1 + M) \neq 1, \\ -q^{n-1} & \text{if } \chi_2 = \chi_0, \chi_1 \neq \chi_0 \text{ and } \chi_1(1 + M) = 1, \\ -\chi_1(-1)q^{n-1} & \text{if } \chi_1 \neq \chi_0, \chi_1\chi_2 = \chi_0 \text{ and } \chi_1(1 + M) = 1, \\ 0 & \text{if } \chi_1 \neq \chi_0, \chi_1\chi_2 = \chi_0 \text{ and } \chi_1(1 + M) \neq 1. \end{cases}$$

Proof. (i) From (17), if $\chi_1 = \chi_2 = \chi_0$, then $J(\chi_1, \chi_2) = (q - 2)q^{n-1}$.

(ii) If $\chi_2 = \chi_0$ and $\chi_1(1 + M) \neq 1$, then $\chi_1 \neq \chi_0$ and

$$J(\chi_1, \chi_2) = \sum_{x \in R^*(1 + M)} \chi_1(x) = \sum_{x \in R^*} \chi_1(x) - \sum_{x \in 1 + M} \chi_1(x) = 0 \text{ (by (7))}.$$

(iii) If $\chi_2 = \chi_0$, $\chi_1 \neq \chi_0$ and $\chi_1(1 + M) = 1$, then

$$J(\chi_1, \chi_2) = \sum_{x \in R^*(1 + M)} \chi_1(x) = \sum_{x \in R^*} \chi_1(x) - \sum_{x \in (1 + M)} 1 = -q^{n-1} \text{ (by (7)).}$$

(iv) If $\chi_1 \neq \chi_0$ and $\chi_1\chi_2 = \chi_0$, then $\chi_2 = \chi_1^{-1} = \chi_1$ and

$$J(\chi_1, \chi_2) = \sum_{x \in R^*(1 + M)} \chi_1(x)\chi_1(1 - x)$$

$$= \chi_1(-1) \sum_{x \in R^*(1 + M)} \chi_1(x(x - 1)^{-1}) \text{ (let } z = x(x - 1)^{-1})$$

$$= \chi_1(-1) \sum_{z \in (1 + M)} \chi_1(z)$$

$$= -\chi_1(-1) \sum_{z \in (1 + M)} \chi_1(z) \text{ (by (7))}$$

$$= \begin{cases} -\chi_1(-1)q^{n-1} & \text{if } \chi_1(1 + M) = 1, \\ 0 & \text{if } \chi_1(1 + M) \neq 1 \text{ (by (7)),} \end{cases}$$

where the third equality follows that for each $x \in R^*(1 + M)$ multiplying $x$ by $(x - 1)^{-1}$ permutes $R^*(1 + M)$.

Theorem 3.2. For $k = 1, 2, \ldots, n - 1$ and $\chi_1, \chi_2 \in \hat{R}^*$,

$$J_{p^k}(\chi_1, \chi_2) = \sum_{x \in R^*} \chi_1(x)\chi_2(p^k - x)$$

$$= \begin{cases} (q - 1)q^{n-1} & \text{if } \chi_1 = \chi_2 = \chi_0, \\ 0 & \text{if } \chi_2 = \chi_0 \text{ and } \chi_1 \neq \chi_0, \\ \chi_1(-1)(q - 1)q^{n-1} & \text{if } \chi_1 \neq \chi_0, \chi_1\chi_2 = \chi_0 \text{ and } \chi_1(1 + M) = 1, \\ \chi_1(-1)q^{k}S(k) & \text{if } \chi_1 \neq \chi_0, \chi_1\chi_2 = \chi_0 \text{ and } \chi_1(1 + M) \neq 1, \end{cases}$$
where

\[ S(k) = \sum_{z_0 \in \mathcal{T}^*} \chi_1 \left( 1 + p^k z_0 + p^{k+1} z_1 + \cdots + p^{n-k-1} z_{n-k-1} \right). \tag{18} \]

\textbf{Proof.} (i) If \( \chi_1 = \chi_2 = \chi_0 \), then \( J_{p^k}(\chi_1, \chi_2) = \sum_{x \in \mathcal{T}^*} 1 = (q-1)q^{n-1} \).

(ii) If \( \chi_2 = \chi_0 \) and \( \chi_1 \neq \chi_0 \), then, by (7), \( J_{p^k}(\chi_1, \chi_2) = \sum_{x \in \mathcal{T}^*} \chi_1(x) = 0 \).

(iii) If \( \chi_1 \neq \chi_0 \) and \( \chi_1 \chi_2 = \chi_0 \), then \( \chi_2 = \chi_1^{-1} = \frac{\chi_1}{\chi_1} \) and

\[ J_{p^k}(\chi_1, \chi_2) = \sum_{x \in \mathcal{T}^*} (p^k - x) = \chi_1(-1) \sum_{x \in \mathcal{T}^*} x(x-p^k)^{-1} \quad \text{(since } x-p^k \in \mathcal{T}^*) \]

\[ = \chi_1(-1) \sum_{x \in \mathcal{T}^*} \chi_1(1+p^k(x-p^k)^{-1}) \quad \text{(let } z = (x-p^k)^{-1}) \]

\[ = \chi_1(-1) \sum_{x \in \mathcal{T}^*} \chi_1(1+p^k z). \]

Since \( p^k z \in \mathcal{T}^* \) for all \( z \in \mathcal{T}^* \), if \( \chi_1(1+M) = 1 \), then

\[ J_{p^k}(\chi_1, \chi_2) = \chi_1(-1)(q-1)q^{n-1}. \]

Assume \( \chi_1(1+M) \neq 1 \). Let \( z = z_0 + z_1 p + \cdots + z_{n-1} p^{n-1} \), \( z_0 \in \mathcal{T}^* \), \( z_1, \ldots, z_{n-1} \in \mathcal{T} \) as in (1). Then we have

\[ J_{p^k}(\chi_1, \chi_2) = \chi_1(-1) \sum_{z_0 \in \mathcal{T}^*, z_1, \ldots, z_{n-1} \in \mathcal{T}} \chi_1 \left( 1 + p^k (z_0 + z_1 p + \cdots + p^{n-1} z_{n-1}) \right) \]

\[ = \chi_1(-1)q^k \sum_{z_0 \in \mathcal{T}^*, z_1, \ldots, z_{n-1} \in \mathcal{T}} \chi_1 \left( 1 + p^k z_0 + \cdots + p^{n-k-1} z_{n-k-1} \right). \]

This completes the proof. \( \square \)

\textbf{Remark 3.3.} Let \( R = GR(p^2, m) \) and \( \chi_1, \chi_2 \in \overline{R}^* \). If \( \chi_1 \neq \chi_0 \), \( \chi_1 \chi_2 = \chi_0 \) and \( \chi_1(1+M) \neq 1 \), then from (18) we have

\[ S(1) = \sum_{z_0 \in \mathcal{T}^*} \chi_1(1+p z_0) = \sum_{z_0 \in \mathcal{T}} \chi_1(1+p z_0) - 1 \]

\[ = \sum_{\varphi_a \in \mathcal{P}_q} \varphi_a(z_0) - 1 \quad \text{(from } \chi \text{) in Remark 2.2) \]

\[ = -1 \quad \text{(by } \varphi_a \text{ is nontrivial and } (7)). \]

Thus \( J_p(\chi_1, \chi_2) = -\chi_1(-1)q \), which is given in [6, Theorem 4.1].

\textbf{Proposition 3.4.} Let \( \chi_1, \ldots, \chi_l \in \overline{R}^* \).
(i) For \( l \geq 3 \),
\[
J(\chi_1, \ldots, \chi_l) = \begin{cases} 
(q - 1)q^{n-1}l - 1 & \text{if } \chi_1, \ldots, \chi_l \text{ are all trivial,} \\
0 & \text{if some but not all of } \chi_i \text{ are trivial.}
\end{cases}
\]

(ii) For \( l \geq 2 \), if \( \chi_l \) is nontrivial, then
\[
J_0(\chi_1, \ldots, \chi_l) = \sum_{s_1, \ldots, s_l \in R^*} \chi_1(s_1) \cdots \chi_l(s_l)
\]
\[
= \begin{cases} 
0 & \text{if } \chi_1 \cdots \chi_l = \chi_0, \\
\chi_l(-1)(q - 1)q^{n-1}J(\chi_1, \ldots, \chi_{l-1}) & \text{if } \chi_1 \cdots \chi_l \neq \chi_0.
\end{cases}
\]

Proof. For (i), if \( l - 1 \) of the terms in \( s_1 + \cdots + s_l = 1 \) is chosen, the last term is uniquely determined. These \( l - 1 \) terms can be chosen in \((q - 1)q^{n-1})^{l-1}\) ways, this proves part one. For the second part we have ordered the characters in such way that \( \chi_1, \ldots, \chi_j \) are nontrivial and \( \chi_{j+1}, \ldots, \chi_l \) are trivial, where \( 1 \leq j \leq l - 1 \). Then
\[
J(\chi_1, \ldots, \chi_l) = \sum_{s_1, \ldots, s_l \in R^*} \chi_1(s_1) \cdots \chi_l(s_l) = \sum_{s_1, \ldots, s_l \in R^*} \chi_1(s_1) \cdots \chi_j(s_j)
\]
\[
= \sum_{s_1, \ldots, s_j \in R^*} \chi_1(s_1) \cdots \chi_j(s_j) \sum_{s_{j+1}, \ldots, s_l \in R^*} 1
\]
\[
= ((q - 1)q^{n-1})^{l-j-1} \sum_{s_1, \ldots, s_j \in R^*} \chi_1(s_1) \cdots \chi_j(s_j)
\]
\[
= ((q - 1)q^{n-1})^{l-j-1} \left( \sum_{s_1 \in R^*} \chi_1(s_1) \right) \cdots \left( \sum_{s_j \in R^*} \chi_j(s_j) \right)
\]
\[
= 0 \text{ (by (7))}.
\]

To prove (ii), we have
\[
J_0(\chi_1, \ldots, \chi_l)
\]
\[
= \sum_{s_1, \ldots, s_l \in R^*} \chi_1(s_1) \cdots \chi_l(s_l)
\]
\[
= \sum_{s_i \in R^*} \left( \sum_{s_1, \ldots, s_{l-1} \in R^*} \chi_1(s_1) \cdots \chi_{l-1}(s_{l-1}) \right) \chi_l(s_l) \text{ (let } s_i = -s_l t_i) \right)
\]
\[
= \chi_1 \cdots \chi_{l-1}(-1) \left( \sum_{t_1, \ldots, t_{l-1} \in R^*} \chi_1(t_1) \cdots \chi_{l-1}(t_{l-1}) \right) \left( \sum_{s_l \in R^*} \chi_l(s_l) \right)
\]
\[
\begin{aligned}
&= \begin{cases} 
0 & \text{if } \chi_1 \cdots \chi_t \neq \chi_0, \\
\chi_t(-1)(q - 1)q^{h - 1}J(\chi_1, \ldots, \chi_{t - 1}) & \text{if } \chi_1 \cdots \chi_t = \chi_0,
\end{cases}
\end{aligned}
\]
where the last equality follows from (7).

**Theorem 3.5.** Let \(\chi_1, \ldots, \chi_{t + 1} \in \hat{R}^*\) be nontrivial characters with \(\chi_1 \cdots \chi_{t + 1} = \chi_0\). If \(\psi \in \hat{R}^*\) is trivial on \(M\), then

\[
J(\chi_1, \ldots, \chi_t) = \frac{1}{q^a} \chi_{t + 1}(-1)G(\chi_1, \psi) \cdots G(\chi_{t + 1}, \psi)
\quad \text{(19)}
\]

\[
= \frac{G(\chi_1, \psi) \cdots G(\chi_t, \psi)}{G(\chi_1, \cdots, \chi_t, \psi)}
\quad \text{(20)}
\]

and

\[
|J(\chi_1, \ldots, \chi_t)|^2 = q^{n(t - 1)}.
\quad \text{(21)}
\]

**Proof.** Since \(\chi_1 \cdots \chi_{t + 1} = \chi_0\), (16) implies that

\[
J(\chi_1, \ldots, \chi_t)
= \chi_1 \cdots \chi_t(-1) \sum_{s_1, \ldots, s_t \in \hat{R}^*} \chi_1(s_1) \cdots \chi_t(s_t)
= \frac{\chi_{t + 1}(-1)}{(q - 1)q^{n - 1}} \sum_{s_{t + 1} \in \hat{R}^*} (\chi_1 \cdots \chi_{t + 1})(s_{t + 1}) \sum_{s_1, \ldots, s_t \in \hat{R}^*} \chi_1(s_1) \cdots \chi_t(s_t)
= \frac{\chi_{t + 1}(-1)}{(q - 1)q^{n - 1}} \sum_{s_{t + 1} \in \hat{R}^*} \sum_{s_1, \ldots, s_t \in \hat{R}^*} \chi_1(s_{t + 1}s_1) \cdots \chi_t(s_{t + 1}s_t) \chi_{t + 1}(s_{t + 1})
= \frac{\chi_{t + 1}(-1)}{(q - 1)q^{n - 1}} \sum_{u_1, \ldots, u_{t + 1} \in \hat{R}^*} \chi_1(u_1) \cdots \chi_t(u_t) \chi_{t + 1}(u_{t + 1}).
\quad \text{(22)}
\]

From (22) and (14) in Proposition 2.8 we have

\[
\chi_{t + 1}(-1)(q - 1)q^{n - 1}J(\chi_1, \ldots, \chi_t)
= \sum_{u_1, \ldots, u_{t + 1} \in \hat{R}^*} \left( \frac{1}{q^a} G(\chi_1, \psi) \sum_{t_1 \in \hat{R}^*} \chi_1(t_1^{-1}u_1) \right)
\times \cdots \times \left( \frac{1}{q^a} G(\chi_{t + 1}, \psi) \sum_{t_{t + 1} \in \hat{R}^*} \chi_{t + 1}(t_{t + 1}^{-1}u_{t + 1}) \right)
= \frac{1}{q^{a(t + 1)}} G(\chi_1, \psi) \cdots G(\chi_{t + 1}, \psi) \sum_{t_1, \ldots, t_{t + 1} \in \hat{R}^*} \chi_1(t_1^{-1}) \cdots \chi_{t + 1}(t_{t + 1}^{-1}).
\]
Hence
\[ \sum_{u_1, \ldots, u_{l+1} \in R^*} \frac{\psi(t_1 u_1 + \cdots + t_{l+1} u_{l+1})}{u_1 + \cdots + u_{l+1} = 0} \]

On the other hand, we have
\[ \sum_{u_1, \ldots, u_{l+1} \in R^*} \frac{\psi(t_1 u_1 + \cdots + t_{l+1} u_{l+1})}{u_1 + \cdots + u_{l+1} = 0} = \sum_{u_1, \ldots, u_{l+1} \in R^*} \frac{\psi(u_1(t_1 - t_{l+1}) + \cdots + u_l(t_1 - t_{l+1}) + t_{l+1}(u_1 + \cdots + u_{l+1}))}{u_1 + \cdots + u_{l+1} = 0} = \sum_{u_1, \ldots, u_{l+1} \in R^*} \psi(u_1(t_1 - t_{l+1})) \cdots \psi(u_l(t_1 - t_{l+1})). \]

Hence
\[ \chi_{l+1}(-1)(q - 1)q^{n-1}J(\chi_1, \ldots, \chi_l) \]
\[ = \frac{1}{q^{n(l+1)}} G(\chi_1, \psi) \cdots G(\chi_l, \psi) \sum_{t_1, \ldots, t_{l+1} \in R^*} \chi_{l+1}(t_1^{-1}) \cdots \chi_{l+1}(t_{l+1}^{-1}) \]
\[ \times \sum_{u_1, \ldots, u_{l+1} \in R^*} \frac{\psi(u_1(t_1 - t_{l+1})) \cdots \psi(u_l(t_1 - t_{l+1}))}{u_1 + \cdots + u_{l+1} = 0} \]
\[ = \frac{1}{q^{n(l+1)}} G(\chi_1, \psi) \cdots G(\chi_l, \psi) \]
\[ \times \sum_{t_{l+1} \in R^*} \chi_{l+1}(t_{l+1}^{-1}) \prod_{i=1}^{l} \left\{ \sum_{t_i \in R^*} \chi_i(t_i^{-1}) \sum_{u_i \in R^*} \frac{\psi(u_i(t_i - t_{l+1}))}{u_i} \right\}. \]

Since for each \( t_{l+1} \in R^* \)
\[ \sum_{t_i \in R^*} \chi_i(t_i^{-1}) \sum_{u_i \in R^*} \frac{\psi(u_i(t_i - t_{l+1}))}{u_i} \]
\[ = \chi_i(t_{l+1}^{-1}) \sum_{u_i \in R^*} 1 + \sum_{t_i \in R^*} \chi_i(t_i^{-1}) \sum_{u_i \in R^*} \frac{\psi(u_i(t_i - t_{l+1}))}{u_i} \]
\[ = (q - 1)q^{n-1}\chi_i(t_{l+1}^{-1}) + \sum_{t_i \in R^*} \chi_i(t_i^{-1}) \sum_{u_i \in R^*} \frac{\psi(u_i(t_i - t_{l+1}))}{u_i} \]
\[ = (q - 1)q^{n-1}\chi_i(t_{l+1}^{-1}) \]
\[ + \sum_{t_i \in R^*} \chi_i(t_i^{-1}) \left\{ \sum_{u_i \in R} \frac{\psi(t_i - t_{l+1}, u_i)}{u_i} - \sum_{u_i \in M} \frac{\psi(u_i(t_i - t_{l+1}))}{u_i} \right\} \]
\[ = (q - 1)q^{n-1}\chi_i(t_{l+1}^{-1}) - q^{n-1} \sum_{t_i \in R^*} \chi_i(t_i^{-1}). \]
Proof. From (10) and (15), we have

\[ (q - 1)q^{n-1} \chi_i(t_{i+1}^{-1}) - q^{n-1} \left( \sum_{t_i \in R^*} \chi_i(t_i^{-1}) - \chi_i(t_{i+1}^{-1}) \right) \]

\[ = (q - 1)q^{n-1} \chi_i(t_{i+1}^{-1}) + q^{n-1} \chi_i(t_{i+1}^{-1}) \]

\[ = q^n \chi_i(t_{i+1}^{-1}), \]

where the fourth equality follows from (7) and \( \psi(u_i(t_i - t_{i+1})) = 1 \) (since \( t_i - t_{i+1} \neq 0 \) and \( u_i(t_i - t_{i+1}) \in M \) for all \( u_i \in M \)), and where the sixth equality follows from (7). Hence

\[ \chi_{i+1}(-1)(q - 1)q^{n-1}J(\chi_1, \ldots, \chi_i) \]

\[ = \frac{1}{q^n} \chi_{i+1}(-1)G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi) \left\{ q^n \sum_{t_{i+1} \in R^*} (\chi_1 \cdots \chi_{i+1})(t_{i+1}^{-1}) \right\} \]

\[ = \frac{1}{q^n} \chi_{i+1}(-1)G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi)q^n(q - 1)q^{n-1} \]

\[ = \frac{q - 1}{q} G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi). \]

Since \( \chi_1 \cdots \chi_i = \chi_{i+1}^{-1} \in \hat{R}^* \) is nontrivial, by (12) in Proposition 2.6 we have \( G(\chi_1 \cdots \chi_i, \psi) \neq 0 \). Thus we have

\[ J(\chi_1, \ldots, \chi_i) \]

\[ = \frac{1}{q^n} \chi_{i+1}(-1)G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi) \]

\[ = \frac{1}{q^n} \chi_{i+1}(-1)G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi) \]

\[ = \frac{1}{q^n} \chi_1 \cdots \chi_i(-1)G(\chi_1, \psi) \cdots G(\chi_i, \psi) \]

\[ = \frac{G(\chi_1, \psi) \cdots G(\chi_i, \psi)}{G(\chi_1 \cdots \chi_i, \psi)} \]

(by (11)).

Again, by (12) in Proposition 2.6 we have \( |J(\chi_1, \ldots, \chi_i)|^2 = q^{n(i-1)}. \)

\[ \square \]

**Corollary 3.6.** Let \( \chi_1, \ldots, \chi_{i+1} \in \hat{R}^* \) be nontrivial characters with \( \chi_1 \cdots \chi_{i+1} = \chi_0 \). If \( \psi \in \hat{R}^+ \) is nontrivial on \( M \), then

\[ J(\chi_1, \ldots, \chi_{i+1}) = -\chi_{i+1}(-1)J(\chi_1, \ldots, \chi_i) + (q - 1) \sum_{k=1}^{n-1} J^{\psi}(\chi_1, \ldots, \chi_{i+1}). \]

**Proof.** From (10) and (15), we have

\[ G(\chi_1, \psi) \cdots G(\chi_{i+1}, \psi) \]

\[ = \left( \sum_{s_1 \in R^*} \chi_1(s_1)\psi(s_1) \right) \cdots \left( \sum_{s_{i+1} \in R^*} \chi_{i+1}(s_{i+1})\psi(s_{i+1}) \right). \]
\[
\sum_{s_1, \ldots, s_{l+1} \in R^*} \chi_1(s_1) \cdots \chi_{l+1}(s_{l+1}) \psi(s_1 + \cdots + s_{l+1}) = \sum_{s \in R} \left( \sum_{s_1, \ldots, s_{l+1} \in R^* \atop s_1 + \cdots + s_{l+1} = s} \chi_1(s_1) \cdots \chi_{l+1}(s_{l+1}) \right) \psi(s)
\]
\[
= J_0(\chi_1, \ldots, \chi_{l+1}) + \sum_{s \in R \setminus \{0\}} J_s(\chi_1, \ldots, \chi_{l+1}) \psi(s) \text{ (let } s = p^k u \text{ as in (2)})
\]
\[
= J_0(\chi_1, \ldots, \chi_{l+1}) + \sum_{k=0}^{n-1} \sum_{u \in R^*} \chi_1 \cdots \chi_{l+1}(u) J_{p^k}(\chi_1, \ldots, \chi_{l+1}) \psi(p^k u)
\]
\[
= J_0(\chi_1, \ldots, \chi_{l+1}) + \sum_{k=0}^{n-1} J_{p^k}(\chi_1, \ldots, \chi_{l+1}) \sum_{u \in R^*} \psi(p^k u)
\]
\[
= J_0(\chi_1, \ldots, \chi_{l+1}) + J(\chi_1, \ldots, \chi_{l+1}) \left( \sum_{u \in R} \psi(u) - \sum_{u \in M} \psi(u) \right) + \sum_{k=1}^{n-1} J_{p^k}(\chi_1, \ldots, \chi_{l+1}) \sum_{u \in R^*} 1 \text{ (since } \psi(p^k u) = 1 \text{ for all } k = 1, \ldots, n-1)\)
\]
\[
= J_0(\chi_1, \ldots, \chi_{l+1}) - q^{n-1} J(\chi_1, \ldots, \chi_{l+1}) + (q-1)q^{n-1} \sum_{k=1}^{n-1} J_{p^k}(\chi_1, \ldots, \chi_{l+1}),
\]
where the last equality follows from (7). Hence from Proposition 3.4(ii) and (19) in Theorem 3.5 we have
\[
\chi_{l+1}(-1)q^n J(\chi_1, \ldots, \chi_{l+1})
= \chi_{l+1}(-1)(q-1)q^{n-1} J(\chi_1, \ldots, \chi_{l+1}) - q^{n-1} J(\chi_1, \ldots, \chi_{l+1})
+ (q-1)q^{n-1} \sum_{k=1}^{n-1} J_{p^k}(\chi_1, \ldots, \chi_{l+1}),
\]
which completes the proof. \(\square\)
