# AN ARTINIAN RING HAVING THE STRONG LEFSCHETZ PROPERTY AND REPRESENTATION THEORY 

Yong-Su Shin

#### Abstract

It is well-known that if chark $=0$, then an Artinian monomial complete intersection quotient $\mathbb{k}\left[x_{1}, \ldots, x_{n}\right] /\left(x_{1}^{a_{1}}, \ldots, x_{n}^{a_{n}}\right)$ has the strong Lefschetz property in the narrow sense, and it is decomposed by the direct sum of irreducible $\mathfrak{s l}_{2}$-modules. For an Artinian ring $A=$ $\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{6}, x_{2}^{6}, x_{3}^{6}\right)$, by the Schur-Weyl duality theorem, there exist 56 trivial representations, 70 standard representations, and 20 sign representations inside $A$. In this paper we find an explicit basis for $A$, which is compatible with the $S_{3}$-module structure.

## 1. Introduction

Let $R=\mathbb{k}\left[x_{1}, \ldots, x_{n}\right]=\bigoplus_{i>0} R_{i}$ be an $n$-variable polynomial ring over a field of characteristic 0 , and let $\bar{I}$ be a homogeneous ideal of $R$, and $A:=R / I$. The Hilbert function of $A$ is a function, $\mathbf{H}_{A}: \mathbb{N} \rightarrow \mathbb{N}$, defined by

$$
\mathbf{H}_{A}(t):=\operatorname{dim}_{\mathbb{k}} R_{t}-\operatorname{dim}_{k} I_{t} .
$$

If $I$ is a homogeneous ideal for which $\sqrt{I}=\left(x_{1}, \ldots, x_{n}\right)$ and $m+1$ is the least positive integer such that $\left(x_{1}, \ldots, x_{n}\right)^{m+1} \subseteq I$, then

$$
A=\mathbb{k} \oplus A_{1} \oplus \cdots \oplus A_{m} \quad \text { where } \quad A_{m} \neq 0 .
$$

In this case, we call $m$ the socle degree of $A$.
We say that an Artinian $\mathbb{k}$-algebra $A=\oplus_{i \geq 0} A_{i}$ has the weak Lefschetz property (WLP) if there is a linear form $\ell \in A_{1}$ such that the linear map $\times \ell: A_{i} \rightarrow A_{i+1}$ has maximal rank for all $i \geq 0$. In addition, we say that $A$ has the strong Lefschetz property (SLP) if the map $\times \ell^{d}: A_{i} \rightarrow A_{i+d}$ has maximal rank for every $i \geq 0$ and $d \geq 1([4,5,7-11])$. In these cases, $\ell$ is called a weak or strong Lefschetz element of $A$. If the Hilbert function of an Artinian algebra $A$ having the SLP is symmetric and unimodal, then we say that $A$ has the $S L P$ in the narrow sense (see [4]).

[^0]The WLP and SLP are strongly connected to many topics in algebraic geometry, commutative algebra, combinatorics, and representation theory. The manuscript [4] gives an overview of the Lefschetz properties from a different prospective focusing on representation theory and combinatorial connections and provides a wonderfully comprehensive exploration of the Lefschetz properties. R. Stanley [10] and J. Watanabe [11] proved that an Artinian monomial complete intersection quotient $A:=\mathbb{k}\left[x_{1}, \ldots, x_{n}\right] /\left(x_{1}^{a_{1}}, \ldots, x_{n}^{a_{n}}\right)$ has the SLP in the narrow sense.

Moreover, $A$ has the SLP in the narrow sense if and only if $A$ can be decomposed by

$$
\begin{equation*}
A \cong \bigoplus_{i=0}^{\left\lfloor\frac{m}{2}\right\rfloor} V(m-2 i)^{\oplus a_{i}} \tag{1.1}
\end{equation*}
$$

where $a_{0}=1, a_{i}=\operatorname{dim}_{\mathfrak{k}} A_{i}-\operatorname{dim}_{\mathfrak{k}} A_{i-1}$ for $1 \leq i \leq m$, and $V(m-2 i)$ is an $(m-2 i+1)$-dimensional irreducible $\mathfrak{s l}_{2}$-module for such $i$ (see $[4,8,11]$ for the details of $\mathfrak{s l}_{2}$-representation theory).

Let $S_{n}$ be the symmetric group on $n$-letters. For $\sigma \in S_{n}$ and $f\left(x_{1}, \ldots, x_{n}\right) \in$ $\mathbb{k}\left[x_{1}, \ldots, x_{n}\right], S_{n}$ acts on $\mathbb{k}\left[x_{1}, \ldots, x_{n}\right]$ by

$$
\sigma \cdot f\left(x_{1}, \ldots, x_{n}\right)=f\left(x_{\sigma^{-1}(1)}, \ldots, x_{\sigma^{-1}(n)}\right)
$$

Note that an ideal $I=\left(x_{1}^{d}, \ldots, x_{n}^{d}\right)$ is invariant under the action of the group $S_{n}$, and so an algebra $R / I$ is isomorphic to the tensor product $V^{\otimes n}$ of an $n$ dimensional vector space $V=\mathbb{k}[x] /\left(x^{d}\right)$, where the tensor product $V^{\otimes n}$ is the space Schur-Weyl duality (see $[3,4,11]$ ). The general linear group $G L_{d}(\mathbb{k}):=$ $G L_{d}$ acts on the space $V^{\otimes n}$, i.e.,

$$
g\left(v_{1} \otimes \cdots \otimes v_{n}\right)=g v_{1} \otimes \cdots \otimes g v_{n}
$$

for $g \in G L_{d}$ and $v_{1} \otimes \cdots \otimes v_{n} \in V^{\otimes n}$. It is clear that two actions commute with each other, i.e., $g \circ \sigma=\sigma \circ g$. Hence the space $V^{\otimes n}$ is given a structure of a bimodule for the product group $S_{n} \times G L_{d}$. By the Schur-Weyl duality theorem, the tensor product $V^{\otimes n}$ is isomorphic to

$$
A \cong \bigoplus_{\substack{\lambda \vdash n \\ \ell(\lambda) \leq d}} S^{\lambda} \otimes V(\lambda)
$$

as an $S_{n} \times G L_{d}$-module, where $\lambda$ is a partition of $n$ with length $\ell(\lambda) \leq d$ and $V(\lambda)$ is an irreducible $\mathfrak{s l}_{2}$-module associated with a partition $\lambda$ of $n$ (see [4, 6,8$]$ for details).

In this article, we find an explicit basis for $A$, which is compatible with the $S_{n}$-module structure for $n=3$ and $a_{1}=a_{2}=a_{3}=6$. Moreover, if we find a highest weight vector (representation) in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ (see [4,8]), then we can find the rest of representations (vectors) in the basis for $A$ applying $\times \ell:=x_{1}+x_{2}+x_{3}$ as many times as we need. Thus
we introduce only highest and lowest weight vectors in each irreducible $\mathfrak{s l}_{2}-$ module component of $A$ with the three representations, i.e., trivial, standard, and sign representations.

We linked full calculations for Section 3 to Arxiv to make this paper shortened (see Lie-algebra-fulltext.pdf).

## 2. $\mathfrak{s l}_{2}$-representation theory and Schur-Weyl duality

In this section, we first introduce the definition of a Lie algebra and $\mathfrak{s l}_{2}$ representation theory. As we mentioned in the introduction, an Artinian ring $A:=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{d}, x_{2}^{d}, x_{3}^{d}\right)$ can be decomposed by irreducible $\mathfrak{s l}_{2}$-modules (see Equation (1.1)). Moreover, we shall introduce how to find a representation in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ among the three representations, i.e., trivial, standard, and sign representation having a highest weight inside $A$ with $d=6$, and show the details how to find and calculate them in each degree (in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ ) in the next section.

Definition 2.1. Let $\mathfrak{g}$ be a vector space over a field $\mathbb{k}$. $\mathfrak{g}$ is a Lie algebra if there exists a bilinear product [,]: $\mathfrak{g} \times \mathfrak{g} \rightarrow \mathfrak{g}$ such that
(a) $[x, y]=-[y, x]$;
(b) $[x,[y, z]]+[y,[z, x]]+[z,[x, y]]=0$.

Let $\mathfrak{s l}_{2}$ be the set of all $2 \times 2$ matrices having trace 0 . Define

$$
[x, y]=x y-y x
$$

for $x, y \in \mathfrak{s l}_{2}$. Set

$$
e=\left[\begin{array}{ll}
0 & 1 \\
0 & 0
\end{array}\right], \quad f=\left[\begin{array}{ll}
0 & 0 \\
1 & 0
\end{array}\right], \quad h=\left[\begin{array}{cc}
1 & 0 \\
0 & -1
\end{array}\right] .
$$

Then

$$
\begin{equation*}
[e, f]=h, \quad[h, e]=2 e, \quad[h, f]=-2 f \tag{2.1}
\end{equation*}
$$

Thus $\mathfrak{s l}_{2}$ is a Lie algebra generated by $e, f, h$ with defining relations (2.1), i.e.,

$$
\mathfrak{s l}_{2}=\mathbb{k} e \oplus \mathbb{k} h \oplus \mathbb{k} f
$$

For each $m \in \mathbb{Z}_{\geq 0}$, there exists a unique (up to isomorphism) $(m+1)$ dimensional irreducible $\mathfrak{s l}_{2}$-module $V(m)$ with a basis $\left\{u, f u, \ldots, f^{m} u\right\}[6]$, where the $\mathfrak{s l}_{2}$-action is given by

$$
\begin{align*}
& e \cdot\left(f^{k} u\right)=k(m-k+1) f^{k-1} u, \\
& f \cdot\left(f^{k} u\right)=f^{k+1} u, \quad \text { and }  \tag{2.2}\\
& h \cdot\left(f^{k} u\right)=(m-2 k) f^{k} u .
\end{align*}
$$

For a finite-dimensional $\mathfrak{s l}_{2}$-module $V, v \in V$ is called a highest weight vector if $e \cdot v=0$, and $w \in V$ is called a lowest weight vector if $f \cdot w=0$. We say that $v$ has weight $k$ if $h \cdot v=k v$ (see $[4,6,8]$ ).

Definition-Example 2.2 ([8, Example 2.2]). There are 3 irreducible representations of $S_{3}$ corresponding to the partitions $\lambda=(3),(2,1)$, and $(1,1,1)$ of 3 . The standard tableaux of shape $\lambda$ are given below (see $[1,2,8]$ ).

$$
\begin{array}{ll}
\lambda=(3), & \begin{array}{|l|l|l|}
\hline 1 & 2 & 3 \\
\hline
\end{array}, \\
\lambda=(2,1), & \begin{array}{|l|l|l|l|}
\hline & 2 \\
3 & & , & \begin{array}{|l|l}
1 & 3 \\
\hline 2 & \\
\hline
\end{array}, \\
\lambda=(1,1,1), & \begin{array}{|l|}
\hline 1 \\
\hline 2 \\
\hline
\end{array} \\
\hline
\end{array}
\end{array}
$$

Hence $\operatorname{dim}_{\mathfrak{k}} S^{(3)}=\operatorname{dim}_{\mathfrak{k}} S^{(1,1,1)}=1$ and $\operatorname{dim}_{\mathfrak{k}} S^{(2,1)}=2$. The 1-dimensional representations $S^{(3)}$ and $S^{(1,1,1)}$ are called the trivial representation and sign representation, respectively. We will call the 2-dimensional representation $S^{(2,1)}$ the standard representation.

Let $A:=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{6}, x_{2}^{6}, x_{3}^{6}\right)$. Then the Hilbert function of $A$ is
$\left.\mathbf{H}_{A}: \begin{array}{llllllllllllllll} & 1 & 3 & 6 & 10 & 15 & 21 & 25 & 27 & 27 & 25 & 21 & 15 & 10 & 6 & 3\end{array}\right)$.

Since $A$ has the SLP in the narrow sense, we see that the $\mathfrak{s l}_{2}$-module decomposition of $A$ is
$A \cong V(15) \oplus V(13)^{\oplus 2} \oplus V(11)^{\oplus 3} \oplus V(9)^{\oplus 4} \oplus V(7)^{\oplus 5} \oplus V(5)^{\oplus 6} \oplus V(3)^{\oplus 4} \oplus V(1)^{\oplus 2}$.
The Schur-Weyl duality implies

$$
A \cong V((3)) \otimes S^{(3)} \oplus V((2,1)) \otimes S^{(2,1)} \oplus V((1,1,1)) \otimes S^{(1,1,1)}
$$

By counting the number of semi-standard tableaux with entries in $1,2, \ldots, 6$ (see [1,2]), we obtain

$$
\operatorname{dim}_{\mathfrak{k}} V((3))=56, \quad \operatorname{dim}_{\mathbb{k}} V((2,1))=70, \quad \text { and } \quad \operatorname{dim}_{\mathfrak{k}} V((1,1,1))=20 .
$$

It follows that there are 56 copies of trivial representations, 70 copies of standard representations, and 20 copies of sign representations in the $S_{3}$-module decomposition of $A$ (see Figure 1). It is not hard to find where each representation exists in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ since it is enough to find a highest weight vector in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ (see the bold 1's in the following diagram). We can also obtain all representations after we apply the multiplication map by $\ell=x_{1}+x_{2}+x_{3}$ to a highest weight vector as many times as we need.

While the sum of each column in Figure 1 indicates the Hilbert function, the sum of each row specifies the dimension of an irreducible $\mathfrak{s l}_{2}$-module component of $A$. Since a degree 0 highest weight vector of an irreducible $\mathfrak{s l}_{2}$-module $V(15)$ in Figure 1 is $1 \in A_{0}$, we see that 1 generates a trivial representation.

| $A_{0}$ | $A_{1}$ | $A_{2}$ | $A_{3}$ | $A_{4}$ | $A_{5}$ | $A_{6}$ | $A_{7}$ | $A_{8}$ | $A_{9}$ | $A_{10}$ | $A_{11}$ | $A_{12}$ | $A_{13}$ | $A_{14}$ | $A_{15}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 16 trivial representations |
|  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |  | 14 standard representations |

|  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  | 8 standard representations |
|  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  | 6 trivial representations |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  | 6 sign representations |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  | 6 standard representations |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  |  |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  | 6 standard representations |
|  |  |  |  |  | 1 | 1 | 1 | 1 | 1 | 1 |  |  |  |  |  |  |
|  |  |  |  |  |  | 1 | 1 | 1 | 1 |  |  |  |  |  |  | 4 trivial representations |
|  |  |  |  |  |  | 1 | 1 | 1 | 1 |  |  |  |  |  |  | 4 sign representations |
|  |  |  |  |  |  | 1 | 1 | 1 | 1 |  |  |  |  |  |  | 4 standard representations |
|  |  |  |  |  |  | 1 | 1 | 1 | 1 |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  | 1 | 1 |  |  |  |  |  |  |  | 2 standard representations |
|  |  |  |  |  |  |  | 1 | 1 |  |  |  |  |  |  |  |  |

Figure 1. $\mathfrak{s l}_{2}$-decompositions (the bold 1 's are the locations of highest weight vectors)

Now consider a degree 1 highest weight vectors of the two irreducible $\mathfrak{s l}_{2}{ }^{-}$ module components $V(13)^{\oplus 2}$ of $A$ in Figure 1. Recall that $\mathbf{H}_{A}(1)=3$ and we already have a trivial representation $\ell$ in degree 1. Furthermore, notice that we have a 2 -dimensional standard representation

$$
\mathbb{k}\left(x_{1}-x_{2}\right) \oplus \mathbb{k}\left(x_{1}-x_{3}\right)
$$

in degree 1 from the partition

$$
\lambda=(2,1), \begin{array}{|l|l|}
\hline 1 & 2 \\
\hline 3 & \\
\hline
\end{array}, \begin{array}{|l|l|}
\hline 1 & 3 \\
\hline 2 & \\
\hline
\end{array} .
$$

Hence we find all kinds of representations having a highest weight in degree 1.
Now we look at the degree 2 (the three irreducible $\mathfrak{s l}_{2}$-module components $V(11)^{\oplus 3}$ of $A$ ). We still don't have a sign representation in degree 2 , and so we have to decide 3 -dimensional representations in degree 2 having a highest weight with trivial and standard representations, which are one trivial representation and one 2-dimensional standard representation. Indeed, they are from the previous cases for $3 \leq d \leq 5$ in [8].

As we mentioned before, we have a highest weight sign representation

$$
\mathbb{k}\left(\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)\right)
$$

in degree 3 (in the four irreducible $\mathfrak{s l}_{2}$-module components $V(9)^{\oplus 4}$ of $A$ ) from the partition

$$
\lambda=(1,1,1), \begin{array}{|l|}
\hline 1 \\
\hline 2 \\
\hline 3 \\
\hline
\end{array}
$$

We also assign one trivial and one 2-dimensional standard representations having a highest weight in degree 3 as in the previous cases for $3 \leq d \leq 5$, recursively (see [8]). After we apply multiplication map by $\ell$, we obtain 9 more trivial, standard, and sign representations, respectively.

By an analogous argument with the previous cases for $3 \leq d \leq 5$ in [8], we find trivial, standard, and sign representations in degrees $4,5,6$, and 7 (in irreducible $\mathfrak{s l}_{2}$-module components $V(7)^{\oplus 5}, V(5)^{\oplus 6}, V(3)^{\oplus 4}$, and $V(1)^{\oplus 2}$ of $A$ ) in Figure 1, respectively.

## 3. The $\left(S_{3} \times G L_{6}\right)$-module structure of $\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{6}, x_{2}^{6}, x_{3}^{6}\right)$

In this section, we find an explicit basis for $A:=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{6}, x_{2}^{6}, x_{3}^{6}\right)$ in Theorem 3.1, which is compatible with the $S_{3}$-module structure based on Schur-Weyl duality with trivial, standard, and sign representations.

As we mentioned in the introduction, we linked full calculations to Arxiv to make this paper shortened (see Lie-algebra-fulltext.pdf).

### 3.1. 56 trivial representations

We start with trivial representations inside $A$. In Section 2, we mention that there exist 56 trivial representations inside $A$ with the location of a highest weight vector in each irreducible $\mathfrak{s l}_{2}$-module component of $A$ in Figure 1. We now find them in each degree.

First, a highest weight vector $1 \in A_{0}$ in degree 0 generates the trivial representation in degree 0 , and so we obtain 15 more trivial representations.

Recall that we don't have any trivial representation in degree 1 (in the two irreducible $\mathfrak{s l}_{2}$-module components $V(13)^{\oplus 2}$ of $A$ ).

Since the polynomials of degree $2, x_{1}^{2}+x_{2}^{2}+x_{3}^{2}$ and $x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}$, are invariant under $S_{3}$-action, we see that

$$
P=a\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right)+b\left(x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}\right)
$$

is a candidate polynomial for a generator of the degree 2 trivial representation. Moreover, since we expect $P$ is a highest weight vector of $V(11)$, we need to impose the condition $F^{12}(P)=0$, which gives $4 a+5 b=0$. We may take

$$
P=5\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right)-4\left(x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}\right)
$$

and $P$ generates 11 more trivial representations.
Let us move onto the degree 3 cases. By an analogous argument, since the polynomials of degree $3, x_{1}^{3}+x_{2}^{3}+x_{3}^{3}, x_{1}^{2} x_{2}+x_{1}^{2} x_{3}+x_{2}^{2} x_{3}+x_{1} x_{2}^{2}+x_{1} x_{3}^{2}+x_{2} x_{3}^{2}$,
and $x_{1} x_{2} x_{3}$, are invariant under $S_{3}$-action, we see that

$$
P=a\left(x_{1}^{3}+x_{2}^{3}+x_{3}^{3}\right)+b\left(x_{1}^{2} x_{2}+x_{1}^{2} x_{3}+x_{2}^{2} x_{3}+x_{1} x_{2}^{2}+x_{1} x_{3}^{2}+x_{2} x_{3}^{2}\right)+c\left(x_{1} x_{2} x_{3}\right)
$$

can be a candidate polynomial for a generator of the degree 3 trivial representation. Since we expect $P$ is a highest weight vector of $V(9)$, we need to have $F^{10}(P)=0$, which yields

$$
126 a+380 b+75 c=0 \quad \text { and } \quad 27 a+94 b+20 c=0 .
$$

Taking $a=50, b=-45$, and $c=144$, we get

$$
P=50\left(x_{1}^{3}+x_{2}^{3}+x_{3}^{3}\right)-45\left(x_{1}^{2} x_{2}+x_{1}^{2} x_{3}+x_{2}^{2} x_{3}+x_{1} x_{2}^{2}+x_{1} x_{3}^{2}+x_{2} x_{3}^{2}\right)+144\left(x_{1} x_{2} x_{3}\right) .
$$

As usual, apply $F$ repeatedly to get 9 more trivial representations.
By the same argument as above, for the degree 4 candidate, let

$$
\begin{aligned}
P= & a\left(x_{1}^{4}+x_{2}^{4}+x_{4}^{4}\right)+b\left(x_{1}^{3} x_{2}+x_{1}^{3} x_{3}+x_{2}^{3} x_{3}+x_{1} x_{2}^{3}+x_{1} x_{3}^{3}+x_{2} x_{3}^{3}\right) \\
& +c\left(x_{1}^{2} x_{2}^{2}+x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{2}\right)+d\left(x_{1}^{2} x_{2} x_{3}+x_{1} x_{2}^{2} x_{3}+x_{1} x_{2} x_{3}^{2}\right) .
\end{aligned}
$$

Imposing the condition $F^{8}(P)=0$, we obtain the following equations
$8 a+28 b+16 c+15 d=0, \quad 8 a+37 b+24 c+30 d=0, \quad$ and $\quad a+8 b+6 c+8 d=0$.
Then we get $a=10 t, b=-8 t, c=9 t$, and $d=0$ for some $t \in \mathbb{N}$. Hence we have

$$
\begin{aligned}
P= & 10\left(x_{1}^{4}+x_{2}^{4}+x_{3}^{4}\right)-8\left(x_{1}^{3} x_{2}+x_{1}^{3} x_{3}+x_{2}^{3} x_{3}+x_{1} x_{2}^{3}+x_{1} x_{3}^{3}+x_{2} x_{3}^{3}\right) \\
& +9\left(x_{1}^{2} x_{2}^{2}+x_{1}^{2} x_{3}^{2}+x_{2}^{2} x_{3}^{2}\right) .
\end{aligned}
$$

For the degree 5 candidate, let

$$
\begin{aligned}
P= & a\left(x_{1}^{5}+x_{2}^{5}+x_{3}^{5}\right)+b\left(x_{1}^{4} x_{2}+x_{1}^{4} x_{3}+x_{2}^{4} x_{3}+x_{1} x_{2}^{4}+x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right) \\
& +c\left(x_{1}^{3} x_{2}^{2}+x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2}^{3}+x_{1}^{2} x_{3}^{2}+x_{2}^{2} x_{3}^{3}\right) \\
& +d\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}+x_{1} x_{2} x_{3}^{3}\right) \\
& +e\left(x_{1}^{2} x_{2}^{2} x_{3}+x_{1} x_{2}^{2} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{2}\right) .
\end{aligned}
$$

Imposing the condition $F^{6}(P)=0$, we obtain the following equations

$$
\begin{array}{ll}
6 a+36 b+60 c+15 d+10 e & =0, \\
15 a+111 b+171 c+90 d+95 e & =0, \\
10 a+60 b+86 c+60 d+75 e & =0, \quad \text { and } \\
b+3 c+2 d+3 e & =0
\end{array}
$$

Taking $a=150, b=-75, c=15, d=96$, and $e=-54$,

$$
\begin{aligned}
P= & 150\left(x_{1}^{5}+x_{2}^{5}+x_{3}^{5}\right)-75\left(x_{1}^{4} x_{2}+x_{1}^{4} x_{3}+x_{2}^{4} x_{3}+x_{1} x_{2}^{4}+x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right) \\
& +15\left(x_{1}^{3} x_{2}^{2}+x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2}^{3}+x_{1}^{2} x_{3}^{2}+x_{2}^{2} x_{3}^{3}\right) \\
& +96\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}+x_{1} x_{2} x_{3}^{3}\right)-54\left(x_{1}^{2} x_{2}^{2} x_{3}+x_{1} x_{2}^{2} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{2}\right) .
\end{aligned}
$$

So, we have 6 more trivial representations.

Note that so far we have found 52 trivial representations. We shall find 4 more trivial representations in degree 6. Let

$$
\begin{aligned}
P= & a\left(x_{1}^{5} x_{2}+x_{1}^{5} x_{3}+x_{2}^{5} x_{3}+x_{1} x_{2}^{5}+x_{1} x_{3}^{5}+x_{2} x_{3}^{5}\right) \\
& +b\left(x_{1}^{4} x_{2}^{2}+x_{1}^{4} x_{3}^{2}+x_{2}^{4} x_{3}^{2}+x_{1}^{2} x_{2}^{4}+x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right) \\
& +c\left(x_{1}^{4} x_{2} x_{3}+x_{1} x_{2}^{4} x_{3}+x_{1} x_{2} x_{3}^{4}\right)+d\left(x_{1}^{3} x_{2}^{3}+x_{1}^{3} x_{3}^{3}+x_{2}^{3} x_{3}^{3}\right) \\
& +e\left(x_{1}^{3} x_{2}^{2} x_{3}+x_{1}^{3} x_{2} x_{3}^{2}+x_{1}^{2} x_{2}^{3} x_{3}+x_{1} x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{3}+x_{1} x_{2}^{2} x_{3}^{3}\right) \\
& +f\left(x_{1}^{2} x_{2}^{2} x_{3}^{2}\right) .
\end{aligned}
$$

By applying the condition $F^{4}(P)=0$, we obtain the following equations

$$
\begin{array}{ll}
2 a+8 b+6 d & =0 \\
5 a+16 b+5 c+12 d+10 e & =0, \\
10 a+16 b+12 c+6 d+23 e+4 f & =0, \\
7 b+4 c+6 d+16 e+3 f & =0, \quad \text { and } \\
8 b+6 c+9 d+44 e+12 f & =0
\end{array}
$$

Hence we have

$$
a=0, b=15, c=-24, d=-20, e=12, \text { and } f=-12,
$$

i.e.,

$$
\begin{aligned}
P= & 15\left(x_{1}^{4} x_{2}^{2}+x_{1}^{4} x_{3}^{2}+x_{2}^{4} x_{3}^{2}+x_{1}^{2} x_{2}^{4}+x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right) \\
& -24\left(x_{1}^{4} x_{2} x_{3}+x_{1} x_{2}^{4} x_{3}+x_{1} x_{2} x_{3}^{4}\right)-20\left(x_{1}^{3} x_{2}^{3}+x_{1}^{3} x_{3}^{3}+x_{2}^{3} x_{3}^{3}\right) \\
& +12\left(x_{1}^{3} x_{2}^{2} x_{3}+x_{1}^{3} x_{2} x_{3}^{2}+x_{1}^{2} x_{2}^{3} x_{3}+x_{1} x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{3}+x_{1} x_{2}^{2} x_{3}^{3}\right) \\
& -12\left(x_{1}^{2} x_{2}^{2} x_{3}^{2}\right),
\end{aligned}
$$

and thus we have 4 more trivial representations. Hence we have constructed the basis of all 56 trivial representations inside $A$ in Figure 1 according to highest weight vectors in degrees $0,2,3,4,5$, and 6 .

### 3.2. 70 standard representations

Now we work on the standard representations inside $A$. As we mentioned in Section 2, we know the two polynomials

$$
P_{1}=x_{1}-x_{2} \quad \text { and } \quad Q_{1}=x_{1}-x_{3}
$$

generate an standard representation in degree 1, and 13 more in higher degree by multiplying $F$ repeatedly.

Consider an standard representation in degree 2 having a highest weight. Since two polynomials

$$
P_{1}=x_{1}-x_{2} \quad \text { and } \quad Q_{1}=x_{1}-x_{3}
$$

generate an standard representation, we can put

$$
P_{2}=\left(x_{1}-x_{2}\right)\left(a\left(x_{1}+x_{2}\right)+b x_{3}\right)=a x_{1}^{2}-a x_{2}^{2}+b x_{1} x_{3}-b x_{2} x_{3}
$$

and impose the condition $F^{12}\left(P_{2}\right)=0$. Then we get an equation $8 a+5 b=0$ and obtain

$$
\begin{aligned}
& P_{2}=5 x_{1}^{2}-5 x_{2}^{2}-8 x_{1} x_{3}+8 x_{2} x_{3}, \quad \text { and } \\
& Q_{2}=5 x_{1}^{2}-5 x_{3}^{2}-8 x_{1} x_{2}+8 x_{2} x_{3} .
\end{aligned}
$$

It is obvious that $P_{2}$ and $Q_{2}$ are linearly independent. Then 11 more standard representations generated by $P_{2}$ and $Q_{2}$.

For the degree 3 candidate, we begin with

$$
P_{3}=a x_{1}^{3}-a x_{2}^{3}+b x_{1}^{2} x_{2}-b x_{1} x_{2}^{2}+c x_{1}^{2} x_{3}-c x_{2}^{2} x_{3}+d x_{1} x_{3}^{2}-d x_{2} x_{3}^{2}
$$

and impose the condition $F^{8}\left(P_{3}\right)=0$. Then we get

$$
\begin{array}{ll}
9 a+5 b+8 c+3 d & =0, \quad \text { and } \\
27 a+15 b+35 c+20 d=0 .
\end{array}
$$

If we take $a=5, b=-9$, and $c=d=0$, then we obtain

$$
\begin{aligned}
& P_{3}=5 x_{1}^{3}-5 x_{2}^{3}-9 x_{1}^{2} x_{2}+9 x_{1} x_{2}^{2} \\
& Q_{3}=5 x_{1}^{3}-5 x_{3}^{2}-9 x_{1}^{2} x_{3}+9 x_{1} x_{3}^{2} .
\end{aligned}
$$

Now we get 10 more standard representations.
Let us work on the degree 4 case. Let

$$
\begin{aligned}
P_{4}= & a x_{1}^{4}-a x_{2}^{4}+b x_{1}^{3} x_{2}-b x_{1} x_{2}^{3}+c x_{1}^{3} x_{3}-c x_{2}^{3} x_{3}+d x_{1}^{2} x_{3}^{2}-d x_{2}^{2} x_{3}^{2} \\
& +e x_{1} x_{3}^{3}-e x_{2} x_{3}^{3}+f x_{1}^{2} x_{2} x_{3}-f x_{1} x_{2}^{2} x_{3}
\end{aligned}
$$

be a candidate for a degree 4 highest weight vector of $V(8)$. Then the condition $F^{8}(P)=0$ yields a system of linear equations

$$
\begin{aligned}
& 224 a+280 b+252 c+112 d+14 e+140 f=0, \\
& 280 a+350 b+504 c+392 d+112 e+280 f=0, \\
& 168 a+168 b+420 c+504 d+252 e+210 f=0, \quad \text { and } \\
& 56 a+112 b+210 c+280 d+140 e+140 f=0 .
\end{aligned}
$$

If we take $d=e=0$, then we have $a=25, b=c=-20$, and $f=36$, and thus we obtain two dimensional standard representations.

$$
\left\{\begin{aligned}
P_{4}= & 25 x_{1}^{4}-25 x_{2}^{4}-20 x_{1}^{3} x_{2}+20 x_{1} x_{2}^{3}-20 x_{1}^{3} x_{3}+20 x_{2}^{3} x_{3} \\
& +36 x_{1}^{2} x_{2} x_{3}-36 x_{1} x_{2}^{2} x_{3} \\
Q_{4}= & 25 x_{1}^{4}-25 x_{3}^{4}-20 x_{1}^{3} x_{3}+20 x_{1} x_{3}^{3}-20 x_{1}^{3} x_{2}+20 x_{2} x_{3}^{3} \\
& +36 x_{1}^{2} x_{2} x_{3}-36 x_{1} x_{2} x_{3}^{2}
\end{aligned}\right.
$$

Now we have 7 more 2-dimensional standard representations.
On the other hand, if we take $b=f=0$, then we have $a=5, c=e=-8$, and $d=9$. So we have another 2 -dimensional standard representations given below:

$$
\left\{\begin{array}{l}
P_{4}^{\prime}=5 x_{1}^{4}-5 x_{2}^{4}-8 x_{1}^{3} x_{3}+8 x_{2}^{3} x_{3}+9 x_{1}^{2} x_{3}^{2}-9 x_{2}^{2} x_{3}^{2}-8 x_{1} x_{3}^{3}+8 x_{2} x_{3}^{3}, \\
Q_{4}^{\prime}=5 x_{1}^{4}-5 x_{3}^{4}-8 x_{1}^{3} x_{2}+8 x_{2} x_{3}^{3}+9 x_{1}^{2} x_{2}^{2}-9 x_{2}^{2} x_{3}^{2}-8 x_{1} x_{2}^{3}+8 x_{2}^{3} x_{3} .
\end{array}\right.
$$

Now we have another 7 more 2-dimensional standard representations. Note that the pairs $\left(F^{i}\left(P_{4}\right), F^{i}\left(Q_{4}\right)\right)$ and $\left(F^{i}\left(P_{4}^{\prime}\right), F^{i}\left(Q_{4}^{\prime}\right)\right)$ generate two distinct (linearly independent) standard representations in degree 4 for each $i=0,1, \ldots, 7$.

We now move on to the degree 5 . Let

$$
\begin{aligned}
P_{5}= & a x_{1}^{5}-a x_{2}^{5}+b x_{1}^{4} x_{2}-b x_{1} x_{2}^{4}+c x_{1}^{4} x_{3}-c x_{2}^{4} x_{3}+d x_{1}^{3} x_{2}^{2}-d x_{1}^{2} x_{2}^{3} \\
& +e x_{1}^{3} x_{3}^{2}-e x_{2}^{3} x_{3}^{2}+f x_{1}^{2} x_{3}^{3}-f x_{2}^{2} x_{3}^{3}+g x_{1} x_{3}^{4}-g x_{2} x_{3}^{4} \\
& +h x_{1}^{3} x_{2} x_{3}-h x_{1} x_{2}^{3} x_{3}+i x_{1}^{2} x_{2} x_{3}^{2}-i x_{1} x_{2}^{2} x_{3}^{2}
\end{aligned}
$$

be a candidate for a degree 5 highest weight vector of $V(6)$. Then the condition $F^{6}(P)=0$ yields a system of linear equations

$$
\begin{array}{ll}
15 a+45 b+24 c+30 d+9 e+30 h+5 i & =0, \\
20 a+60 b+60 c+40 d+54 e+14 f+75 h+30 i & =0, \\
15 a+30 b+60 c+15 d+90 e+54 f+9 g+60 h+45 i & =0, \\
15 b+20 c+15 d+45 e+30 f+5 g+40 h+30 i & =0, \\
6 a+6 b+30 c+60 e+60 f+24 g+15 h+20 i & =0, \quad \text { and } \\
6 b+15 c+6 d+60 e+75 f+30 g+30 h+40 i & =0 .
\end{array}
$$

If we take $h=i=0$, then we get

$$
a=1, b=1, c=-2, d=-1, e=2, f=-2, \text { and } g=2 .
$$

Now we get 2-dimensional standard representation in degree 5 given below:

$$
\left\{\begin{aligned}
P_{5}= & x_{1}^{5}-x_{2}^{5}+x_{1}^{4} x_{2}-x_{1} x_{2}^{4}-2 x_{1}^{4} x_{3}+2 x_{2}^{4} x_{3}-x_{1}^{3} x_{2}^{2}+x_{1}^{2} x_{2}^{3} \\
& +2 x_{1}^{3} x_{3}^{2}-2 x_{2}^{3} x_{3}^{2}-2 x_{1}^{2} x_{3}^{3}+2 x_{2}^{2} x_{3}^{3}+2 x_{1} x_{3}^{4}-2 x_{2} x_{3}^{4} \\
Q_{5}= & x_{1}^{5}-x_{3}^{5}+x_{1}^{4} x_{3}-x_{1} x_{3}^{4}-2 x_{1}^{4} x_{2}+2 x_{2} x_{3}^{4}-x_{1}^{3} x_{3}^{2}+x_{1}^{2} x_{3}^{3} \\
& +2 x_{1}^{3} x_{2}^{2}-2 x_{2}^{2} x_{3}^{3}-2 x_{1}^{2} x_{2}^{3}+2 x_{2}^{3} x_{3}^{2}+2 x_{1} x_{2}^{4}-2 x_{2}^{4} x_{3}
\end{aligned}\right.
$$

Taking $d=f=g=0$, we get

$$
a=15, b=-5, c=-10, e=5, h=8, \text { and } i=-9 .
$$

Hence we obtain another 2-dimensional standard representations.

$$
\left\{\begin{aligned}
P_{5}^{\prime}= & 15 x_{1}^{5}-15 x_{2}^{5}-5 x_{1}^{4} x_{2}+5 x_{1} x_{2}^{4}-10 x_{1}^{4} x_{3}+10 x_{2}^{4} x_{3}+5 x_{1}^{3} x_{3}^{2}-5 x_{2}^{3} x_{3}^{2} \\
& +8 x_{1}^{3} x_{2} x_{3}-8 x_{1} x_{2}^{3} x_{3}-9 x_{1}^{2} x_{2} x_{3}^{2}+9 x_{1} x_{2}^{2} x_{3}^{2} \\
Q_{5}^{\prime}= & 15 x_{1}^{5}-15 x_{3}^{5}-5 x_{1}^{4} x_{3}+5 x_{1} x_{3}^{4}-10 x_{1}^{4} x_{2}+10 x_{2} x_{3}^{4}+5 x_{1}^{3} x_{2}^{2}-5 x_{2}^{2} x_{3}^{3} \\
& +8 x_{1}^{3} x_{2} x_{3}-8 x_{1} x_{2} x_{3}^{3}-9 x_{1}^{2} x_{2}^{2} x_{3}+9 x_{1} x_{2}^{2} x_{3}^{2} .
\end{aligned}\right.
$$

Hence we have 12 standard representations in degree 5 .
We now work on the degree 6 case. Let

$$
\begin{aligned}
P_{6}= & \left(x_{1}-x_{2}\right)\left(a\left(x_{1}^{5}+x_{2}^{5}\right)+b x_{3}^{5}+c\left(x_{1}^{4} x_{2}+x_{1} x_{2}^{4}\right)+d\left(x_{1}^{4} x_{3}+x_{2}^{4} x_{3}\right)\right. \\
& +e\left(x_{1}^{3} x_{2}^{2}+x_{1}^{2} x_{2}^{3}\right)+f\left(x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}\right)+g\left(x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{3}\right)+h\left(x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right) \\
& \left.+p\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}\right)+q\left(x_{1}^{2} x_{2}^{2} x_{3}\right)+r\left(x_{1} x_{2} x_{3}^{3}\right)+s\left(x_{1}^{2} x_{2} x_{3}^{2}+x_{1} x_{2}^{2} x_{3}^{2}\right)\right)
\end{aligned}
$$

be a candidate for a degree 6 highest weight vector, which is annihilated by $F^{4}$. Then we obtain a system of linear equations.

$$
\begin{array}{ll}
4 a+4 c+2 d-8 e-p-2 q & =0, \\
6 a+6 c+8 d-12 e+f-4 p-8 q-5 s & =0, \\
4 c+6 d-4 e+4 f-g-6 q-2 r-8 s & =0, \\
4 a+6 d-4 e-3 g-6 p-6 q-3 r-12 s & =0, \\
c+4 d-e+6 f-4 g-5 h-4 q-8 r-12 s & =0, \\
a-c-6 f-8 g-4 h-4 p-4 r-6 s & =0, \\
b+d+4 f+6 g+4 h & =0, \\
3 b-d+6 g+12 h+p+6 r+4 s & =0, \quad \text { and } \\
2 b-4 f+8 h-p+q+6 r+4 s & =0 .
\end{array}
$$

If we take $e=0$ and $s=-24$, then

$$
\begin{aligned}
& a=15, b=40, c=-5, d=20, f=-20, g=20 \\
& h=-25, p=32, q=24, \text { and } r=24
\end{aligned}
$$

We thus have a 2-dimensional standard representation of degree 6 as follows.

$$
\left\{\begin{aligned}
P_{6}= & \left(x_{1}-x_{2}\right)\left(15\left(x_{1}^{5}+x_{2}^{5}\right)+40 x_{3}^{5}-5\left(x_{1}^{4} x_{2}+x_{1} x_{2}^{4}\right)+20\left(x_{1}^{4} x_{3}+x_{2}^{4} x_{3}\right)\right. \\
& -20\left(x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}\right)+20\left(x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{3}\right)-25\left(x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right) \\
& +32\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}\right)+24\left(x_{1}^{2} x_{2}^{2} x_{3}\right)+24\left(x_{1} x_{2} x_{3}^{3}\right) \\
& \left.-24\left(x_{1}^{2} x_{2} x_{3}^{2}+x_{1} x_{2}^{2} x_{3}^{2}\right)\right) \\
Q_{6}= & \left(x_{1}-x_{2}\right)\left(15\left(x_{1}^{5}+x_{2}^{5}\right)+40 x_{3}^{5}-5\left(x_{1}^{4} x_{2}+x_{1} x_{2}^{4}\right)+20\left(x_{1}^{4} x_{3}+x_{2}^{4} x_{3}\right)\right. \\
& -20\left(x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}\right)+20\left(x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{3}\right)-25\left(x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right) \\
& +32\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}\right)+24\left(x_{1}^{2} x_{2}^{2} x_{3}\right)+24\left(x_{1} x_{2} x_{3}^{3}\right) \\
& \left.-24\left(x_{1}^{2} x_{2} x_{3}^{2}+x_{1} x_{2}^{2} x_{3}^{2}\right)\right)
\end{aligned}\right.
$$

Applying $F$, we get 3 more standard representations.
We now work on the degree 7 cases. Let

$$
\begin{aligned}
P_{7}= & \left(x_{1}-x_{2}\right)\left(a\left(x_{1}^{5} x_{2}+x_{1} x_{2}^{5}\right)+b\left(x_{1}^{5} x_{3}+x_{2}^{5} x_{3}\right)+c\left(x_{1}^{4} x_{2}^{2}+x_{1}^{2} x_{2}^{4}\right)\right. \\
& +d\left(x_{1}^{4} x_{3}^{2}+x_{2}^{4} x_{3}^{2}\right)+e\left(x_{1}^{3} x_{2}^{3}\right)+f\left(x_{1}^{3} x_{3}^{3}+x_{2}^{3} x_{3}^{3}\right)+g\left(x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right) \\
& +h\left(x_{1} x_{3}^{5}+x_{2} x_{3}^{5}\right)+p\left(x_{1}^{4} x_{2} x_{3}+x_{1} x_{2}^{4} x_{3}\right)+q\left(x_{1} x_{2} x_{3}^{4}\right) \\
& +r\left(x_{1}^{3} x_{2}^{2} x_{3}+x_{1}^{2} x_{2}^{3} x_{3}\right)+s\left(x_{1}^{3} x_{2} x_{3}^{2}+x_{1} x_{2}^{3} x_{3}^{2}\right) \\
& \left.+t\left(x_{1}^{2} x_{2} x_{3}^{3}+x_{1} x_{2}^{2} x_{3}^{3}\right)+u\left(x_{1}^{2} x_{2}^{2} x_{3}^{2}\right)\right)
\end{aligned}
$$

be a candidate for a degree 7 highest weight vector, which is annihilated by $F^{2}$. Then we obtain a system of linear equations.

$$
\begin{array}{ll}
a-e & =0, \\
2 a+b-2 e+p-2 r & =0 \\
c+d-e+2 p-2 r-u & =0, \\
a+2 b-c+d-2 r-s-u & =0, \\
-b+f+p+2 s+t & =0, \\
2 d+f+p-r-2 t-2 u & =0 \\
b-f-p-2 s-t & =0, \\
d+2 f+g & =0, \\
-d+g+q+s+2 t & =0, \\
2 f-q+s-2 t-u & =0, \\
d-g-q-s-2 t & =0, \\
-d-2 f-g & =0, \\
f+2 g+h & =0, \\
f-2 h-2 q-t & =0
\end{array}
$$

If we take $a=e=h=r=0$, then we get that

$$
\begin{aligned}
& b=12, c=15, d=15, f=-10, g=5 \\
& p=-12, q=-4, s=18, t=-2, \text { and } u=6 .
\end{aligned}
$$

Hence we have a 2-dimensional standard representation.

$$
\left\{\begin{aligned}
P_{7}= & 15 x_{1}^{5} x_{2}^{2}-15 x_{1}^{4} x_{2}^{3}+15 x_{1}^{3} x_{2}^{4}-15 x_{1}^{2} x_{2}^{5}-24 x_{1}^{5} x_{2} x_{3}+12 x_{1}^{4} x_{2}^{2} x_{3} \\
& -12 x_{1}^{2} x_{2}^{4} x_{3}+24 x_{1} x_{2}^{5} x_{3}+15 x_{1}^{5} x_{3}^{2}+3 x_{1}^{4} x_{2} x_{3}^{2}-12 x_{1}^{3} x_{2}^{2} x_{3}^{2} \\
& +12 x_{1}^{2} x_{2}^{3} x_{3}^{2}-3 x_{1} x_{2}^{4} x_{3}^{2}-15 x_{2}^{5} x_{3}^{2}-10 x_{1}^{4} x_{3}^{3}+8 x_{1}^{3} x_{2} x_{3}^{3} \\
& -8 x_{1} x_{2}^{3} x_{3}^{3}+10 x_{2}^{4} x_{3}^{3}+5 x_{1}^{3} x_{3}^{4}-9 x_{1}^{2} x_{2} x_{3}^{4}+9 x_{1} x_{2}^{2} x_{3}^{4}-5 x_{2}^{3} x_{3}^{4}, \\
Q_{7}= & 15 x_{1}^{5} x_{3}^{2}-15 x_{1}^{4} x_{3}^{3}+15 x_{1}^{3} x_{3}^{4}-15 x_{1}^{2} x_{3}^{5}-24 x_{1}^{5} x_{2} x_{3}+12 x_{1}^{4} x_{2} x_{3}^{2} \\
& -12 x_{1}^{2} x_{2} x_{3}^{4}+24 x_{1} x_{2} x_{3}^{5}+15 x_{1}^{5} x_{2}^{2}+3 x_{1}^{4} x_{2}^{2} x_{3}-12 x_{1}^{3} x_{2}^{2} x_{3}^{2} \\
& +12 x_{1}^{2} x_{2}^{2} x_{3}^{3}-3 x_{1} x_{2}^{2} x_{3}^{4}-15 x_{2}^{2} x_{3}^{5}-10 x_{1}^{4} x_{2}^{3}+8 x_{1}^{3} x_{2}^{3} x_{3}-8 x_{1} x_{2}^{3} x_{3}^{3} \\
& +10 x_{2}^{3} x_{3}^{4}+5 x_{1}^{3} x_{2}^{4}-9 x_{1}^{2} x_{2}^{4} x_{3}+9 x_{1} x_{2}^{4} x_{3}^{2}-5 x_{2}^{4} x_{3}^{3} .
\end{aligned}\right.
$$

Thus we have constructed the basis of all 70 standard representations inside $A$ in Figure 1 according to highest weight vectors in degrees $1,2,3,4,5$, and 6 .

### 3.3. 20 sign representations

We consider the sign representations. We already know that the cubic polynomial

$$
D=\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)
$$

generates the sign representation in degree 3 and multiplying by $F$ repeatedly, we get 9 more sign representations.

We now consider a sign representation in degree 5 . As a candidate, we may take a product of $D$ and a symmetric quadratic polynomial

$$
Q=\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)\left(a\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right)+b\left(x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}\right)\right) .
$$

Imposing the condition $F^{6}(Q)=0$, we get that $a=1$ and $b=0$, and thus we have a sign representation as follows.

$$
Q=\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right) .
$$

Now we have 6 sign representations in degree 5 .
Now consider a sign representation in degree 6. As a candidate, we may take a product of $D$ and a symmetric cubic polynomial

$$
\begin{aligned}
S= & \left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right) \\
& \left(a\left(x_{1}^{3}+x_{2}^{3}+x_{3}^{3}\right)+b\left(x_{1}^{2} x_{2}+x_{1}^{2} x_{3}+x_{1} x_{2}^{2}+x_{2}^{2} x_{3}+x_{1} x_{3}^{2}+x_{2} x_{3}^{2}\right)+c x_{1} x_{2} x_{3}\right) .
\end{aligned}
$$

Imposing the condition $F^{4}(Q)=0$, we obtain the following equation

$$
3 a-4 b-2 c=0 \quad \text { and } \quad 3 a-2 b-3 c=0 .
$$

Taking $a=8, b=3, c=6$, we have a sign representation as

$$
\begin{aligned}
S= & 8\left(x_{1}^{5} x_{2}-x_{1}^{5} x_{3}+x_{2}^{5} x_{3}-x_{1} x_{2}^{5}+x_{1} x_{3}^{5}-x_{2} x_{3}^{5}\right) \\
& +8\left(x_{1}^{3} x_{2}^{2} x_{3}-x_{1}^{2} x_{2}^{3} x_{3}-x_{1}^{3} x_{2} x_{3}^{2}+x_{1} x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{3}-x_{1} x_{2}^{2} x_{3}^{3}\right) \\
& +5\left(-x_{1}^{4} x_{2}^{2}+x_{1}^{2} x_{2}^{4}+x_{1}^{4} x_{3}^{2}-x_{2}^{4} x_{3}^{2}-x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right) .
\end{aligned}
$$

Therefore, we have 3 more sign representations. So we have constructed the basis of all 20 sign representations inside $A$ in Figure 1 according to highest weight vectors in degrees 3,5 , and 6 .

Using the above trivial, standard, and sign representations all we have found, we obtain the following theorem.
Theorem 3.1. Let $A=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{6}, x_{2}^{6}, x_{3}^{6}\right)$. Then the $S_{3}$-module structure of $A$ is completely determined by the following representations.
(a) Trivial representations
(i) degree $0: \mathbb{k}(1)$.
(ii) degree $2: \mathbb{k}\left(5\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right)-4\left(x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}\right)\right)$.
(iii) degree $3: \mathbb{k}\left(50\left(x_{1}^{3}+x_{2}^{3}+x_{3}^{3}\right)-45\left(x_{1}^{2} x_{2}+x_{1}^{2} x_{3}+x_{2}^{2} x_{3}+x_{1} x_{2}^{2}+\right.\right.$ $\left.\left.x_{1} x_{3}^{2}+x_{2} x_{3}^{2}\right)+144\left(x_{1} x_{2} x_{3}\right)\right)$.
(iv) degree 4 : $\mathbb{k}\left(10\left(x_{1}^{4}+x_{2}^{4}+x_{3}^{4}\right)-8\left(x_{1}^{3} x_{2}+x_{1}^{3} x_{3}+x_{2}^{3} x_{3}+x_{1} x_{2}^{3}+\right.\right.$ $\left.\left.x_{1} x_{3}^{3}+x_{2} x_{3}^{3}\right)+9\left(x_{1}^{2} x_{2}^{2}+x_{1}^{2} x_{3}^{2}+x_{2}^{2} x_{3}^{2}\right)\right)$.
(v) degree 5: $\mathbb{k}\left(150\left(x_{1}^{5}+x_{2}^{5}+x_{3}^{5}\right)-75\left(x_{1}^{4} x_{2}+x_{1}^{4} x_{3}+x_{2}^{4} x_{3}+x_{1} x_{2}^{4}+\right.\right.$ $\left.x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right)+15\left(x_{1}^{3} x_{2}^{2}+x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2}^{3}+x_{1}^{2} x_{3}^{2}+x_{2}^{2} x_{3}^{3}\right)+$ $\left.96\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}+x_{1} x_{2} x_{3}^{3}\right)-54\left(x_{1}^{2} x_{2}^{2} x_{3}+x_{1} x_{2}^{2} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{2}\right)\right)$.
(vi) degree $6: \mathbb{k}\left(15\left(x_{1}^{4} x_{2}^{2}+x_{1}^{4} x_{3}^{2}+x_{2}^{4} x_{3}^{2}+x_{1}^{2} x_{2}^{4}+x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right)-\right.$ $24\left(x_{1}^{4} x_{2} x_{3}+x_{1} x_{2}^{4} x_{3}+x_{1} x_{2} x_{3}^{4}\right)-20\left(x_{1}^{3} x_{2}^{3}+x_{1}^{3} x_{3}^{3}+x_{2}^{3} x_{3}^{3}\right)+12\left(x_{1}^{3} x_{2}^{2} x_{3}\right.$ $\left.\left.+x_{1}^{3} x_{2} x_{3}^{2}+x_{1}^{2} x_{2}^{3} x_{3}+x_{1} x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{3}+x_{1} x_{2}^{2} x_{3}^{3}\right)-12\left(x_{1}^{2} x_{2}^{2} x_{3}^{2}\right)\right)$.
(b) Sign representations
(i) degree $3: \mathbb{k}\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)$.
(ii) degree $5: \mathbb{k}\left(\left(x_{1}-x_{2}\right)\left(x_{1}-x_{3}\right)\left(x_{2}-x_{3}\right)\left(x_{1}^{2}+x_{2}^{2}+x_{3}^{2}\right)\right)$.
(ii) degree $6: \mathbb{k}\left(8\left(x_{1}^{5} x_{2}-x_{1}^{5} x_{3}+x_{2}^{5} x_{3}-x_{1} x_{2}^{5}+x_{1} x_{3}^{5}-x_{2} x_{3}^{5}\right)+8\left(x_{1}^{3} x_{2}^{2} x_{3}-\right.\right.$ $\left.x_{1}^{2} x_{2}^{3} x_{3}-x_{1}^{3} x_{2} x_{3}^{2}+x_{1} x_{2}^{3} x_{3}^{2}+x_{1}^{2} x_{2} x_{3}^{3}-x_{1} x_{2}^{2} x_{3}^{3}\right)+5\left(-x_{1}^{4} x_{2}^{2}+x_{1}^{2} x_{2}^{4}+\right.$ $\left.\left.x_{1}^{4} x_{3}^{2}-x_{2}^{4} x_{3}^{2}-x_{1}^{2} x_{3}^{4}+x_{2}^{2} x_{3}^{4}\right)\right)$.
(c) standard representations
(i) degree $1: \mathbb{k}\left(x_{1}-x_{2}\right) \oplus \mathbb{k}\left(x_{1}-x_{3}\right)$.
(ii) degree $2: \mathbb{k}\left(5 x_{1}^{2}-5 x_{2}^{2}-8 x_{1} x_{3}+8 x_{2} x_{3}\right) \oplus \mathbb{k}\left(5 x_{1}^{2}-5 x_{3}^{2}-8 x_{1} x_{2}+\right.$ $\left.8 x_{2} x_{3}\right)$
(iii) degree $3: \mathbb{k}\left(5 x_{1}^{3}-5 x_{2}^{3}-9 x_{1}^{2} x_{2}+9 x_{1} x_{2}^{2}\right) \oplus \mathbb{k}\left(5 x_{1}^{3}-5 x_{3}^{2}-9 x_{1}^{2} x_{3}+\right.$ $\left.9 x_{1} x_{3}^{2}\right)$.
(iv) degree $4: \mathbb{k}\left(25 x_{1}^{4}-25 x_{2}^{4}-20 x_{1}^{3} x_{2}+20 x_{1} x_{2}^{3}-20 x_{1}^{3} x_{3}+20 x_{2}^{3} x_{3}+\right.$ $\left.36 x_{1}^{2} x_{2} x_{3}-36 x_{1} x_{2}^{2} x_{3}\right) \oplus \mathbb{k}\left(25 x_{1}^{4}-25 x_{3}^{4}-20 x_{1}^{3} x_{3}+20 x_{1} x_{3}^{3}-20 x_{1}^{3} x_{2}+\right.$ $20 x_{2} x_{3}^{3}+36 x_{1}^{2} x_{2} x_{3}-36 x_{1} x_{2} x_{3}^{2}$ ), and
$\mathbb{k}\left(5 x_{1}^{4}-5 x_{2}^{4}-8 x_{1}^{3} x_{3}+8 x_{2}^{3} x_{3}+9 x_{1}^{2} x_{3}^{2}-9 x_{2}^{2} x_{3}^{2}-8 x_{1} x_{3}^{3}+8 x_{2} x_{3}^{3}\right) \oplus$ $\mathbb{k}\left(5 x_{1}^{4}-5 x_{3}^{4}-8 x_{1}^{3} x_{2}+8 x_{2} x_{3}^{3}+9 x_{1}^{2} x_{2}^{2}-9 x_{2}^{2} x_{3}^{2}-8 x_{1} x_{2}^{3}+8 x_{2}^{3} x_{3}\right)$.
(iv) degree $5: \mathbb{k}\left(x_{1}^{5}-x_{2}^{5}+x_{1}^{4} x_{2}-x_{1} x_{2}^{4}-2 x_{1}^{4} x_{3}+2 x_{2}^{4} x_{3}-x_{1}^{3} x_{2}^{2}+x_{1}^{2} x_{2}^{3}+\right.$ $\left.2 x_{1}^{3} x_{3}^{2}-2 x_{2}^{3} x_{3}^{2}-2 x_{1}^{2} x_{3}^{3}+2 x_{2}^{2} x_{3}^{3}+2 x_{1} x_{3}^{4}-2 x_{2} x_{3}^{4}\right) \oplus \mathbb{k}\left(x_{1}^{5}-x_{3}^{5}+\right.$ $x_{1}^{4} x_{3}-x_{1} x_{3}^{4}-2 x_{1}^{4} x_{2}+2 x_{2} x_{3}^{4}-x_{1}^{3} x_{3}^{2}+x_{1}^{2} x_{3}^{3}+2 x_{1}^{3} x_{2}^{2}-2 x_{2}^{2} x_{3}^{3}-$ $\left.2 x_{1}^{2} x_{2}^{3}+2 x_{2}^{3} x_{3}^{2}+2 x_{1} x_{2}^{4}-2 x_{2}^{4} x_{3}\right)$, and
$\mathbb{k}\left(15 x_{1}^{5}-15 x_{2}^{5}-5 x_{1}^{4} x_{2}+5 x_{1} x_{2}^{4}-10 x_{1}^{4} x_{3}+10 x_{2}^{4} x_{3}+5 x_{1}^{3} x_{3}^{2}-5 x_{2}^{3} x_{3}^{2}+\right.$ $\left.8 x_{1}^{3} x_{2} x_{3}-8 x_{1} x_{2}^{3} x_{3}-9 x_{1}^{2} x_{2} x_{3}^{2}+9 x_{1} x_{2}^{2} x_{3}^{2}\right) \oplus \mathbb{k}\left(15 x_{1}^{5}-15 x_{3}^{5}-5 x_{1}^{4} x_{3}+\right.$ $5 x_{1} x_{3}^{4}-10 x_{1}^{4} x_{2}+10 x_{2} x_{3}^{4}+5 x_{1}^{3} x_{2}^{2}-5 x_{2}^{2} x_{3}^{3}+8 x_{1}^{3} x_{2} x_{3}-8 x_{1} x_{2} x_{3}^{3}-$ $\left.9 x_{1}^{2} x_{2}^{2} x_{3}+9 x_{1} x_{2}^{2} x_{3}^{2}\right)$
(v) degree $6: \mathbb{k}\left(\left(x_{1}-x_{2}\right)\left(15\left(x_{1}^{5}+x_{2}^{5}\right)+40 x_{3}^{5}-5\left(x_{1}^{4} x_{2}+x_{1} x_{2}^{4}\right)+20\left(x_{1}^{4} x_{3}+\right.\right.\right.$ $\left.x_{2}^{4} x_{3}\right)-20\left(x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}\right)+20\left(x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{3}\right)-25\left(x_{1} x_{3}^{4}+x_{2} x_{3}^{4}\right)+$ $32\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}\right)+24\left(x_{1}^{2} x_{2}^{2} x_{3}\right)+24\left(x_{1} x_{2} x_{3}^{3}\right)-24\left(x_{1}^{2} x_{2} x_{3}^{2}+\right.$ $\left.\left.\left.x_{1} x_{2}^{2} x_{3}^{2}\right)\right)\right) \oplus \mathbb{k}\left(\left(x_{1}-x_{2}\right)\left(15\left(x_{1}^{5}+x_{2}^{5}\right)+40 x_{3}^{5}-5\left(x_{1}^{4} x_{2}+x_{1} x_{2}^{4}\right)+\right.\right.$ $20\left(x_{1}^{4} x_{3}+x_{2}^{4} x_{3}\right)-20\left(x_{1}^{3} x_{3}^{2}+x_{2}^{3} x_{3}^{2}\right)+20\left(x_{1}^{2} x_{3}^{3}+x_{2}^{2} x_{3}^{3}\right)-25\left(x_{1} x_{3}^{4}+\right.$ $\left.x_{2} x_{3}^{4}\right)+32\left(x_{1}^{3} x_{2} x_{3}+x_{1} x_{2}^{3} x_{3}\right)+24\left(x_{1}^{2} x_{2}^{2} x_{3}\right)+24\left(x_{1} x_{2} x_{3}^{3}\right)-24\left(x_{1}^{2} x_{2} x_{3}^{2}\right.$ $\left.\left.+x_{1} x_{2}^{2} x_{3}^{2}\right)\right)$ ).

Remark 3.2. In [8], the authors found an explicit basis for

$$
A:=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{d}, x_{2}^{d}, x_{3}^{d}\right),
$$

which is compatible with the $S_{3}$-module structure for $d=3,4,5$. In this paper, we extend the result to $d=6$.

The following question is worth further study for a complete generalization.
Question 3.3. What is an explicit basis for $A:=\mathbb{k}\left[x_{1}, x_{2}, x_{3}\right] /\left(x_{1}^{d}, x_{2}^{d}, x_{3}^{d}\right)$ which is compatible with the $S_{3}$-module structure for $d \geq 7$ ?
